Not sure but there should be some method of copying a disk under cp/m...

I wonder if Kaypro CP/M disks (or another common format) would work since the drives the ATR8K uses are not Atari SIO-format drives... anybody able to give this a try?

Cheers.
Steve

I would guess that somewhere between $25 and $45 is about the going rate for a good condition, used 130xe but the values do change from time to time. You do see some wacky prices on websites but notice that they usually remain unsold on the websites for a LONG time.

Just my humble $0.02 cents worth.

More and more new devices are powered by very small switching power supplies.
I've seen very "petite" 5V switching supplies up to 5 amps. And as an example,
many powered USB 2.0 hubs come with 5V switchers, rated at 2 to 3 amps. Has
anyone tried using one of these as a replacement for our XL/XE power supplies?
Is there some reason *not* to try this?
Larry

Well yes, maybe. Switching power supplies should *typically* not be used
without any load. However, as a matter of fact, if you switch off the
Atari using its regular power switch, it gets disconnected completely
from the power supply, and this a couple of switching power supplies
cannot stand.

So long,
Thomas

25 bucks? forget it, that would be too low for a mint condition
130xe. I think 50 bucks is the lowest I would go.

Hi Thomas and George-
Likewise, Happy New Year to both of you and thanks for the replies to my question.

> Switching power supplies should *typically* not be used without any load. <

Good point, Thomas. That has always been my understanding, also. But I have seen quite a few of the newer, smaller ones that indicate that there is no minimum load requirement. From what I have seen (mostly in the Jameco catalog) is that the switchers that only supply *one voltage* frequently have no load restriction, while the larger, multi-voltage units still show the 10% load necessary. But it certainly warrants caution -- I might have to add some type of a small dummy load.
Best regards,
Larry

11. Cheesebox / Using a VGA monitor on your 8bit.

Newsgroup: comp.sys.atari.8bit
Date: 2004-01-01 23:39:20 UTC
From: "Z.Beeblebrox" <the.z.guy@comcast.net>
Message-ID: <s_KdnXkHYog3MmmiRVn-ig@comcast.com>
Source record: 17818

I picked up a "cheesebox" so I could use my PCs monitor on my 8-bit.
Now, if I could only get it to work.

Has anybody tried this?

Basically, there's a spot on the cheesebox to plug your PC monitor into.
Plus, there's a modern audio/video type port where it looks like your atari
would plug in, as long as you DON'T use the game/tv switchbox.

The problem lies here....

If you recall how to hook-up your atari to your TV:

1. Plug one end of the atari a/v cable into your atari.
2. Plug the other end of the atari a/v cable into the GAME/TV switchbox.
3. Plug the game/tv switchbox into your TV.
The game/tv switchbox has 2 outputs, "Connect to TV VHF" and
"Connect to Antenna"
But these connectors have those 2 "forked" wires coming out of it.

WELL how do I connect that to the cheesebox? The cheesebox has a modern A/V
type input.
I tried going straight from the atari cable to the cheesebox, avoiding use
of the "game/tv switchbox" but that did not work.

Do I need to go to radio shack and buy a cable to convert the connection?

damn cheesebox.

-z-

Source record: 17819

You'll need a more modern connection, you could go to radio shack and get a F-adapter that would let you plug your RF cable directly into the cheesebox like you mentioned.

But the better option would be to get a Monitor cable for your Atari. You didn't mention which Atari you have but the common Atari RCA cables provide composite output for the 800XL and 130XE computers. The cables are the same 5pin cables for these Ataris and C64's.

I got some from this ebay seller, very reliable:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3067982150&category=3543

Or you can find some online shops that sell them:

http://www.connectworld.net/cgi-bin/iec/L4134

Source record: 17820

Thanks for the reply.

I think I'll go to Radio Shack and see if they have a cable/converter I can use.
I'm assuming with the cheesebox that I still need the atari's "game/tv" box. Although on the atari 800xl, you have to select which tv station you're using (ch.3 or ch.4 US). I guess that doesn't matter.

I saw your e-bay item but don't understand how I'd use that. It's got 4 RCA plugs on it and the atari monitor jack at the other end. My cheesebox has 1 RCA jack input. And my monitor is a regular 15-pin PC (VGA) monitor.

Well, in the meantime, I came to a realization : I still won't have any AUDIO! I'm annoyed with myself!!

I forgot that in addition to video, the atari-to-tv also passes through audio. My cheesebox and PC monitor sure aren't going to be producing any sound.

I think I'm going to ship the cheesebox back to where I bought it. Ugh.

MAYBE someday I can run my old atari 800xl on the same monitor as my PC i'm using here. That'd be nice! It sounds reasonable, doesn't it?

-take care,
Z

lol, I can understand your frustration. Yes that monitor cable for the 800xl has two composite/rca outputs, one is for the video and one is for the audio. So if you do use your cheesebox, then you have to figure something out for the audio. The most practical thing I can think of is to run it through the line-in port of your PC sound card and use your PC speakers while using the monitor for the Atari. Or you can use a TV or VCR just for the audio part.

If you are going to stick to RF (which you shouldn't ;) , the composite output is so much nicer!) then here's what you need to look for a Radio Shack or elsewhere, this eliminates the need for the Atari switchbox, just plug the RF cable into it and then into a modern TV or cheesebox:

Coaxial (F-type) to Female RCA Adapter
Radio Shack part #278-276

http://www.atariage.com/howto/connect.html

remember all the ataris, 2600 to the computers used the same RF cables/switchboxes so it all applies.

Your biggest problem will be noise. While its possible you will find
a switcher brick with a nice clean DC output, its unlikely. Adding a couple
of large filter caps and some smaller ones inside the Atari will take care of
that.

You also wont be able to keep your feet warm on the switcher on those
cold winter nights like you can with the Atari bricks. ;)

Steve

hey, this is almost as fast as real-time. quick responses!

My whole idea was to use my old atari 8-bit without having to make space for a TV (and run cords, power, etc).
Just use my existing PC setup!
If I had to use a TV, it would irk me and more importantly it would annoy my wife. She can't figure out why I still keep the atari "junk"..... :-)
So I definitely don't want a T.V. involved in the solution.

Because I use the SIO2PC cable & program, I don't need an atari disk drive - - just my PC & serial port. So I figured the final step would be to find a replacement for the TV and use my existing PC monitor. Then the only space and power I'd need would be for the Atari 800xl box itself.....pretty small. Something I could "keep set up" all the time.

I actually read that atari age article today already, believe it or not!
But that assumes you want to hook up to your TV. I can understand with modern TVs people may have questions.
Thr input on the back of a new TV combined with VCRs, cable boxes, etc...make it more difficult.

I'll take a look at the radio shack item you listed. I like the idea of running cables to the "line in" on the audio card.
That would work once I had the video converted over too. [via cheesebox or otherwise]
I probably won't have the free time to figure it all out, buy the parts, and set it up. It's starting to become a lot more complex then I originally thought!!

-regards,
Z

I'm just hanging around the AtariAge forums and checking my email and
newsgroups instead of cleaning the house like my wife wants me to :-)

I don't think it's too complex, if I was in your shoes I would buy that
monitor cable from eBay or find an online vendor. I wouldn't pay more than
$5-10 for one. Once you have that cable you can plug in the video-out to
the Cheesebox and you can plug in the audio-out to the line-in of your PC
soundcard and play it through your speakers. So that's only like two steps
:-)

I wouldn't mind trying out a cheesebox setup someday, maybe if I can find a
used one for cheap, lol ;-)

Hello yet again-

Doesn't that monitor cable from ebay have 4 RCA jacks on the one end?
If there were 2, then I'd understand the process....1 for audio, 1 for
video.
But what would I do with 4 jacks? (maybe you just don't use them all, I
don't know!)

And I'd still be left with trying to figure out what I need to buy to adapt
the "game/tv" atari switchbox to the cheesebox.
Since the atari "game/tv switchbox" just has the 300ohm flat antenna piece
2-pronged thingy coming off of it.
(I do have that little 75-ohm cable tv plug that can fit onto the end of the
switchbox too, but that doesn't help my progress)

Well, you're making it sound more "do-able". If I can get the cheesebox
working tomorrow after I visit radioshack, maybe I won't give up!

Yes that monitor cable has 4 jacks, but only 2 of them are used by the Atari. It has 4 because it's a universal cable and also works with C64 and Amiga computers who have different pins with the signals coming out of them. But the picture and sound are great using the two that you are suppossed to use with the Atari. By the way on that cable for Atari computers, you would use the Red for Video and the Yellow for Audio.

>

I think you're missing the point of the monitor cable which gives you a new composite video-out. You won't need the RF cable or the TV switchbox after you have a monitor cable. It completely replaces the old RF out and switchbox. Of course, if you don't get the monitor cable then you just get that coaxial F-adapter and get rid of your switchbox.

So in summary, you are either plugging in the video-out of that monitor cable into your Cheesebox or you plug in the coaxial F-adapter into the cheesebox with a RF cable running from your computer. Get rid of that switchbox! :-)

```
thanks for all of your input!
it's very much appreciated.

I get it now.

I could put the red (video) end into the cheesebox.
Adapt the yellow (audio) to my PC's audio line-in jack.

I think I will give that a shot!

signing off for tonight,
Rob [z]

27. Re: 130xe

Newsgroup: comp.sys.atari.8bit
Date: 2004-01-02 08:35:22 UTC
From: SteveV4V <stevev4v1@comcast.net>
Message-ID: <e3aJb.256715$_M.1180477@attbi_s54>
Source record: 17834

Well, you should realize that there is a difference between what something is worth to you and what the public at large is willing to pay. Here is an example of what I am talking about:

This 130xe came with a LOT of stuff and went for $51.00
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3066301260&category=3537

This 130xe came with over 100 games, a disk drive, 7 books & 2 joysticks for $40.00
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3066479855&category=3528

After seeing these recent auction results, a 130xe by itself for $50 seems a bit steep to me... I'll stand by my original assertion that a good condition, used 130xe is worth between $25-$45 bucks. Of course, mint-in-box examples may fetch a bit more.

Cheers.
Steve

Message-ID: <9a8ae930.0401020853.47f0ab64@posting.google.com>
Source record: 17841

Hello,

I am using Action! to develop some small apps for my 8-bit Ataris. However, I do not have the Runtime or library disks, which I would like to get.

I've seen two public domain Action! runtime packages available, and may try those to develop standalone apps, however, I have not seen any PD libraries to add some important missing features like floating point operations.

First question.. do the PD runtime packages work as well as the original commercial package, and are there any PD libraries which have most of the functionality of the original? If not, are there any sources of the originals and their docs?

Thanks.

Jason Harmon

Its been many years since I've looked into it, but I thought the RT
packages did support floating point. I know I used to create my
own routines for the things that usually required the cartridge, like
setting up graphics modes, and disk access.

If you want a quick type-in program just to play around with,
you can check out this link, looking for Larry's Action Tutorial
section:
http://home.earthlink.net/~spaceclub/news9602.html

That is #19 of a 21-part tutorial you could probably read in an
afternoon:

http://home.earthlink.net/~spaceclub/

It may be too simplistic for your current level, but it does have
some simple routines (printing to the screen, adding large numbers)
with examples of how to use ML in your programs, plus what to
watch out for when trying to run without the cartridge....

The FP routine demos were in The Action! Toolkit. You may be able to find it around if you do a search.

The toolkit was not that great, just a demo of how to use FP IIRC. The procedure for using it is a lot like assembly language: Reserve 6 bytes for storage of each FP, assign pointers in the OS FP area to your 6 byte area, use the ASCII to FP routine in ROM to convert your string i.e. "1234" into its FP representation, etcetera.
>
> First question.. do the PD runtime packages work as well as the

I think I got the PD runtime package off of Compuserve. It did come with a some source code. It has the same functionality as the commercial RT pack. The only problem I noticed with the PD runtime was the Moveblock()<?> routine was slower then the commercial one. I rewrote that at any rate and couldn't tell the difference in performance.

IMHO: There are also some utilities you should pick up. There is one that will automatically give you a list of routines you use. This is useful since you can edit the ~7k RT that compiles to 4k of added code to your "Hello World" demo down to just a couple of extra bytes.

Another one you run while using Action! from the monitor to increase your symbol table size. IIRC there is only ~2k reserved by default, and if you use the PD RT pack w/o editing it down, it will eat it all up before you start to program.

Yeah, live by the Atari, Die by the Atari!
Something about bare feet and power bricks sounds dangerous! It'd be my luck, my dog would casually raise his leg at just the right angle while I'm getting toasty with my Atari and BZZZT! 8-)

Hi -

My order went through for the monitor cable you suggested.
I'll see how that works for me.

In the meantime, I did buy a small adapter at radio shack, but it didn't get me video from my 8bit thru the cheesebox. I thought it would, but no dice.

Physically, I got the adapter(s) i needed to connect, but maybe there's more to it.

I used the atari game/tv switchbox, and connected the flat 300ohm wires to a 75ohm cable style adapter (I also did that back in the day when TVs came with the cable tv connector built in).

THEN (and this is the bit I got as Radio.S.) I stuck an adapter on the end of the 75ohm connector that converts it to a male RCA video jack. So, that plugs into the cheesebox!

As I said, physically, it all connects up but my PC screen doesn't change at all. Boooo!!!!!!!!!

I'll wait for the adapter I ordered to arrive.

Personally, I think $100-$200 is a fair price since they are hard
to come by, but I suppose $50 would be the going rate....

Actually I played 1-3 on the Atari 8-bit and 4-6 on the ST. Ultim
4 was probably the best out of the six. Five was ok and six was
darn right SLOW on the ST, but I was able to finish it. I will
have to give Ultima Online a try, but I would love to be able to
play it using my Hades060 instead of my wife's PC, but I am sure
if that will be ever possible.

The best thing to do is what I do. Get a video converter. This
will have RCA ports (video in) and a monitor PC port (video out).
Connect the monitor cable from the XE to the RCA in-ports on the
converter and then hook the monitor to the video-out monitor port.
Works for me. Oh, for sound just run the black wire on the monitor
cable (from the 8-bit) to a speaker.

Well the once I use is by a company called Matco. The address is
below. It really does not matter which video converter you use.
There are plenty out there. You just have to make sure that it has
RCA video-in ports and a VGA-PC monitor out port.

http://www.mat-co.com/

49. Re: 130xe

Newsgroup: comp.sys.atari.8bit
Date: 2004-01-03 22:50:31 UTC
From: Roy G Biv <8-bitter@8-bit.atari.world>
Message-ID: <Pine.GSO.4.56.0401031651560.18706@shell1>
Source record: 17756

In reply to this from an earlier poster:
->What is the value of a 130xe with manual, monitor cable, and power
->supply that is in mint condition and has been rarely used? I no-
->tice they are selling them at one these atari 8-bit stores for over
->a hundred dollars, but I think that is a bit steep. What is a fair
->price?

On Sat, 03 Jan 2004 at 12:44:20 GMT, "Edward S. Baiz Jr." scrib-
bled:
->I think $100-$200 is a fair price since they are hard to come by,
->but I suppose $50 would be the going rate....

First, a small quibble: There's at least a tiny contradiction between the term "mint condition" and the description of being "rarely used." In my view, mint condition should mean never used at all. A rarely-used computer would be better described as "near-mint" or "like-new" or "almost mint," etc., etc.

Secondly, I'll pass over commenting on which dealer the poster was referring to. Has anybody really seen any actual "store" (with physical "storefront" location) selling Atari 8-bit computer equipment anywhere in North America for more than a decade? I suppose the poster was referring to some mail-order or online vendor: somebody, somewhere out there in the ether. A high-priced vendor, it seems, but let's not probe further into that vendor's identity.

As for the price, $100 seems rather high in my opinion. I suppose 130XEs have attained a certain premium by now as a result of rarity value, if nothing else. However, the internal membranes for the keyboards and the daisy-chain cable connection are so notoriously delicate, and the "feel" of the keys for actual typing is so inferior to the older computers, that I much prefer the 800XL. Many other actual 8-bit users back in the '80s felt the same. I've had an 800XL plugged in for nearly a decade; all my 130XEs are back in the boxes.

I can see a little premium being warranted for a like-new 130XE having with it a box, a P.S., a cable, and the owner's manual book. (132 pages, spiral-bound, copyright 1985, says the one I've got handy.) Perhaps that would warrant an extra $15 to $20 being tacked on -- which is what those items would probably add up to if bought separately from users or advertisers who participate on this newsgroup.

Like-new 130XEs, of course, can be obtained for free if somebody simply watches this newsgroup long enough and waits for somebody to

post an announcement about an old collection being discarded. But on a "must-have-it-right-now" basis, I figure the going rate for a 130XE should be in the $20 to $40 range. (Am I figuring too low? It would be nice to think that 130XEs are retaining more market pricing power than that. If so, then my 8-bit collection would be worth a lot more than the zero I figure it is! <grin>)

If somebody posted a want-ad on several Usenet newsgroups, including this one, looking for somebody who had a 130XE lying around that they'd be willing to part with, the odds are a price in that range could be easily found. Add on the $15 to $20 premium for the package of the other three or four items, and that brings the total to anywhere from $35 to $60. So I come to the same conclusion Ed Baiz came to: $50 would probably be the going rate.

->I've just blown 3 Atari 8bit power supplies hooking each in turn
->to an Indus Drive. I guess I'm wrong, but before I blow another;
->Indus has it's on power supply correct?

This has probably been answered already, but it won't hurt to
repeat this again. (And again, and again, and again!)

I dunno why people insist on plugging Induses into Atari (mean-
ing probably 1050) power supplies. There was a guy at one of the
MIST shows in Indianapolis in the early '90s who swore up and down
that Induses worked on the same current as Atari Company equip-
ment. He blew out two or three Induses before I walked away from
that table in disgust. "Guess that one's no good," he said. Then,
"Guess that one's no good, either!" And on and on and on. It was
a self-fulfilling prophecy.

So one more time: Indus voltage is 11.5 volts DC.

51. Atari 65816 (was: accelerated 8bit)

Newsgroup: comp.sys.atari.8bit
Date: 2004-01-03 23:33:09 UTC
From: Roy G Biv <8-bitter@Atari.8-bit.spectrum>
Message-ID: <Pine.GSO.4.56.0401031815450.18706@shell1>
Source record: 17758

On 14 Dec 2003 at 00:52:07 GMT, Larry White scribbled:
->I should mention that there was a *real* 65816 custom Atari ma-
->chine that was sold mainly for cable TV operators. I *saw* this
->at the "World of Atari" in 1998. It was in a small PC case --
->about the size of a PS2 case. Had a 65816, a built-in Black Box,
->3-1/2" drive, and had the ability to run at 3.52 (?) MHz when run-
->ning in the 65816 mode outside of the normal 64K.

Now the story can be told: In the early '80s, when the chip came
out that Apple later used for the Apple II-GS, my original computer
mentor got the details from the manufacturer (Intel, or was it Motor-
ola?). He called the Atari Company to try to convince them to put
out an "8-16" version of the 8-bit computers, but they were stone
cold to the idea. So they had the chance, but they blew it!

The above post is the first I've ever heard of any 8-16 mod of
the Atari 8-bit that supposedly was done in any quantity (or so the
poster implies). Even if so, the quantity was presumably on the
small side.

your message sounds like you are trying to imply that I was dishonest
in some way, and trying to mislead people. Yes there is a dealer and
there is no need for you to "not probe further" because here is the
link :

http://www.best-electronics-ca.com/130xe.htm

They are called Best Electronics and they sell refurbed NTSC 130xe
(except mine is in mint condition and includes a monitor cable) for
$175 + shipping.

From: mo <momo@atariland.com>
Message-ID: <xrJJb.42042$DC4.21479@fe2.texas.rr.com>
Source record: 17763

Somebody posted a while back wanting to know if there was a 2600 to 800 interface. I found one in Joystick magazine, dec 1983. There's a small review saying that for $795 you can have a 2600 development system that uses the 800 to write and edit programs and the 2600 for on the fly testing. It also has an adapter for VIC20 development, but that seems pointless really.

I picked up some old 8-track storage cases from a thrift store for my
TI cartridges. Not a perfect fit, because of the shape of the
cartridges at the top, so some "arrangement" is necessary.
I don't have my Atari cartridges at hand, but perhaps that would work?

David,

No. You walked away too soon. He blew the Atari power supplies. The reason I know is I took one of the Atari ps apart. Mine had two fuses. The one on the drive side was blown. Thinking as you I replaced the Indus drive but then checked just to see if I had indeed blown the Indus drive. Nope, after plugging in an Indus ps it came up like a champ formatting single and double density and no problems to date. Now the reason I tried an Atari ps on the Indus is the plug was the same, and I had looked and looked for the Indus ps knowing I had worked with the Indus before. Then thinking I could have used an Atari ps I tried one just to see,..then another etc.

FAQ are like docs to me, but I think I've learned a lesson.

I noticed that the cheesebox also has S-Video input. It would be
interesting to see what the video quality is like when going from Atari
Chroma+Luma to SVideo to cheesebox to VGA monitor. If anyone has a chance
to compare this to using the composite input on the box, I'd be interested
to know the difference.

Is that a review or an advertisment?

> It also has an adapter for VIC20 development, but that seems
> pointless really.

Is that Atari 800 -> VIC-20 or VIC-20 -> Atari 2600? The latter is
something known to have been advertised, but never seen working in
real life AFAIK.

I forgot to say the name, it's called the Reads 2600. It's one of those
small reviews in the new products department, about 3 or 4 paragraphs long.
It connects a small interface box via cables and cart conectors from the 800
to 2600 or from the 800 to vic20.
Mo

[cross-posted to c.s.cbm]

Does anyone of the CBM people know about this as a Atari 800 -> VIC-20
development system? I know there was a VIC-20 -> Atari 2600 system
advertised, but AFAIK nobody can remember seeing a working system.

Even if the interface only makes a host computer work like a storage
device feeding the target with data instead of getting it from tape,
disk or ROM, it sounds a little cool at that time. It would be even
more amazing if the host itself can run the target software, but I
assume this was not the case?

Hi
Wanted to know which Stores are in US that have Atari Systems on Sale.
(Atari 8Bit, Atari ST, Atari Lynx, etc)

i'm from chile, and these stores doesnt exists here.
Now i've a HUGE atari collection, and need to complete some pieces! repair
some of them, buy some games to the Lynx, etc.
eBay has been a great store for me.. But sometimes i need some thing that
arent on those sites.
Actually, ive been buying overseas (telegames UK). But shipping costs, make
thing expensive. (Either to Chile, or mailbox in Miami)

Any info, would be appreciated.

Thanks in advance

While on this topic (again), I ran across the following on Yahoo groups:
Yahoo group name: 65GZ032

"The 65GZ032 is the 32-bits version of the well known 6502 (Commodore,
Atari, Apple, etc.), 6510 (C64) and 8502 (C128). It has a built-in MMU-,
cache- and SDRAM-controller. All is realized in FPGA."

Anybody play with this thing yet?

W.

The 65816 was announced (by Western Design Center; essentially Bill Mensch) in 1984 -- I don't know what time of year it was, but it hardly mattered by then. If it was in the first half of 1984 then things were falling apart, people were confused at all the management changes, and there were tons of layoffs happening. If it was after July, things *had* fallen apart, most of the layoffs had happened, and Atari's focus had completely changed.

The Tramiels were interested in getting the ST done. I'll hazard that the 65816 didn't seem like it had enough head-room; there were future versions (and obvious extensions) of the Motorola 68K and the National 32K architectures in the pipe, while the 65816 didn't have much going for it besides being a better 6502. Betting the company on something that probably wasn't ever going to have an MMU or floating point, for instance, wouldn't have been smart. While the 68000-based STs didn't have these, it was certainly talked about (and there were certainly high-end 68K workstations being shipped by other companies; at one point the Tramiels had a Unix binary license for $10 a machine).

Any interest in 8-bitters that the Tramiels had was purely based on what could be done with existing chips and perhaps minor tweaks to the OS. There were no 8-bit chip designers left. The OS folks were no longer around. There *were* unshipped designs, and non-architectural things like new plastics, board layouts, cost reductions and so forth were relatively easy to do. With essentially no 8-bit staff to work with, it's not surprising that pleas for basing a system on the 65816 fell on deaf ears. It's just not where people thought the future was going to be.

Personally I think it was a mistake for Apple to do the IIgs (its development cost a *ton* of money). They should have concentrated on getting Macs better development tools, for instance, rather than sink tens of millions an architecture with a dim future.

Just my opinions. :-)

84. Atari 1200xl keyboard problems

Newsgroup: comp.sys.atari.8bit
Date: 2004-01-05 02:23:30 UTC
From: Jerry Trickey <j_trickey@cox.net>
Message-ID: <kU3Kb.50610$BQ5.7596@fed1read03>
Source record: 17791

Hi gang,

Just dragged out my 1200xl 1050 disk drive, 1010 tape and 1030 modem
after about 15 years in storage.

The good news: Most everything seems to be working well, including my
floppy diskettes (absolutely amazing!)

The bad news: I'm having keyboard problems. Start / Select work
intermittently, and the only other keys that work are: Inverse Video,
3, 6, and B.

Any ideas on how to troubleshoot, or where I can get a keyboard for a
reasonable price?

Thank you in advance,

Jerry

->your message sounds like you are trying to imply that I was dis-
->honest in some way, and trying to mislead people.

Not at all!

The report that a "store" -- meaning a gen-u-wine bricks-and-
mortar, walk-in, physical building, storefront, retail business
location -- exists somewhere which is selling Atari 8-bit computer
equipment was newsworthy. What I said was that you probably were
referring to a "vendor" or "dealer" rather than to what commonly
would be called a "store," but in any case I felt no need to delve
into the identity of that dealer. So I devoted my comments to the
matter of the price.

->Yes there is a dealer ...

That was never in doubt. (Note this time you said "dealer.")

->... and there is no need for you to "not probe further" ...

Thanks! I'm greatly relieved that I won't have to *not* probe
further! <grin!>

->They are called Best Electronics and they sell refurbed NTSC 130xe
->(except mine is in mint condition and includes a monitor cable)
->for $175 + shipping.

WHEW! Before we were talking about a mere $100. Now the price
tag is up to $175! Wow!!

Incidentally, Best Electronics is well-known to regulars on this
newsgroup. In fairness it might be noted that often they've been
mentioned in the context of reasonable or low prices.

->>>One thing I hate is when people sell their crap for more than
->>>you can get it at the dealers! Especially with an opening bid!
->>>It's one thing to start the bid low and see where it ends...

I'm told that E-Bay's programming automatically inserts a lower
bid if the winning bid is higher than it needed to be. So it would
seem that if something sells for a high price, that means that two
or more bidders have bid up the price. Assuming that all bidders
are legitimate (and not shills), then that high price has been
reached as a fair reflection of market forces. If there had been
only one bidder who was trying to lock in success by bidding sky-
high, E-Bay's program would've knocked that amount down to a lower
figure. At least that's what I'm told.

yes, well, your welcome. actually I orig. said over $100. I think
the price has gone up since I posted. 170 is actually 10 dollars more
than a refurbed amiga 1200 which came out in 92 and features a 68020
14mhz, with pretty good graphics etc... so I think the price is
definetly over the top.

One thing I noticed that seems wierd, a 65xe is $100, so they actually
think 64k of memory wrrants the extra $70 or is the 130xe rare?

90. Repairing Disk Imaages

Newsgroup: comp.sys.atari.8bit
Date: 2004-01-05 04:51:08 UTC
From: iquitted@collegeclub.com
Message-ID: <bba8af7b.0401042051.35e3471e@posting.google.com>
Source record: 17697

I have finally managed to convert all my old Atari 800XL floppy disks to disk images that I can use with an emulator. Most of them work fine, but a few of them are kind of scrambled -- when I try to view the disk directory, I'll get part of a file instead. I'm pretty sure these problems have nothing to do with the transfer to my modern computer, because I remember having the same problems on the actual Atari. So anyway, my question is, are there any Mac or PC utilities that I could use to repair my disk images? I do have an Atari program called Sherlock that I've been using, but I think something that would run natively on my computer would be more helpful.

I'm using a Macintosh, but I do have Virtual PC, if there's nothing available for Mac.

Not all disks have a directory to view.. Some are boot disks and just use what the boot sectors 1,2,&3 tell the Atari to load and run. Other disks have there directories stored in non standard directory locations, Magazine disks will do this. Different DOS types also change the normal Atari directory location and structure, and can only be read by the correct DOS ala.. SpartaDOS, CP/M, IBM, etc...

Thanks for archiving your disks and try to identify the disk before trying to repair the original. I am sure there are several emulators for the Atari 8bits that run on the Macintosh, Rainbow for sure.. and now Freeware..

If you remove the keyboard & take out all those little screws holding the back plate on, you will see a sheet of mylar with the contacts on it. Can't remember if it is folded or covered by a separate sheet of plastic. VERY very carefully lift the mylar to separate it from the rest of the keyboard. It tends to really get stuck down with age which is why it's not working. DO NOT tear it because the traces are on the mylar sheet. If any are broken or rotted away redraw them with a conductive pen. Wipe it with a dry cloth and put it all back together. You may have to use a drop of isopropyl alcohol on the cloth if there is any fungus built up.That should do it.

at least on my experience,
When you set a bid for (example, $50) and the actual price is $25
You'll be winning the auction by $25.. If anyone bids higger (but lower than
$50), you still keep winning the auction by the next price. (example : if
other guy bids $34, you are bidding at $35 (auto))

Hope anyone understand what i tried to say :o)
I'm restless xD

Ok. I have a question here. I know this is an old thread, but my server has
low retention and I havn't checked the group in a couple of days...

It's been quite some time since I dusted off my 130 XE and played around
with it, but, if memory serves...

Using that method of getting the signal to the cheesebox would yield you the
worst possible quality video on a VGA monitor with a worthless audio signal
going to it as well. The monitor output is a much better choice. But if you
want uber-quality, hack up an S-video cable for it since the cheesebox has
the input for it.
```

Now, down to my question...

Using this method, would I still be able to use my light gun/pen with a VGA monitor? I would think not due to the monitor having a zillion more color clocks & scan lines to it than a standard TV, plus the cheesebox adapting the signal would probably stop any chances of the Atari being able to figure out where the electron beam was at any given time anyways...

Also, with that thought in mind, wouldn't that screw up programs/games that used artifacting?

Maybe I'm wrong. Just a question I felt like asking...

100. Re: Looking for a "flexible" sector copier

Newsgroup: comp.sys.atari.8bit
Date: 2004-01-05 14:35:26 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3FF9762E.882450A8@students.uni-mainz.de>
Source record: 17707

hmm,
there is a sector copier written by ABBUC Floppydoc Erhard Puetz, it requires a) min. 48k RAM (it does not need nor support any extra RAM!), b) Sparta DOS and c) at least two floppy drives (with or without speeders). The two floppy drives can also be harddrive partitions of up to 16 Megabytes. I never tested this program since it merely works under Sparta DOS, but it has been reported to work ok... where to get ?!? send e-mail to erhard puetz (if you find his e-mail adress) for the newest version or e-mail me for an older version (that has been published in ABBUC magazine some time ago)...

Second there is a sector copier by Carsten Strotmann (I do not own it!) it was programmed with Carsten`s own Forth language (yes, he developed his own Forth interpreter for the A8), meaning it will only work under this interpreter. Afaik you can get both things from Carsten directly (e-mail: Carsten<nospam!>@abbuc.de). the program is similar to Erhards program, meaning it requires at least 48k Ram, two diskdrives (or partitions or ...) and should copy any density from 90kbytes up to 16 mbytes - but I never tested this...

Last not least there is a sector copier for 720kbytes (80 tracks, DD, 18 sectors), I have it in my collection, tested it and it worked ok with all densities up to 720k. alas, this program does not support any floppy speeder. e-mail me, if you are still interested: amp<no spam!>@abbuc.de

Greetings and a happy new year - Andreas.
P.S.: Remove the <no spam!> note from the e-mail adresses...

101. Re: Floppy Board HD Disk Errors

Newsgroup: comp.sys.atari.8bit
Date: 2004-01-05 14:45:38 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3FF97892.2BF9E0B5@students.uni-mainz.de>
Source record: 17708

well,
afaik MyDOS can be or has to be patched for High density (1,44
Megabytes). I think a short info was published in an old ABBUC magazine
a long long time ago (around 1990 or so, when the HDI - High Density
Interface from Erhard Puetz was up to date)...

Besides there are also separate tools available to format a disk in high
density, one is called PERCOM.COM it will format any density 90k up to
1440k (but not write any DOS or Boot sectors), the second program comes
from the Black Box and is called FMTDIR.COM, this one will write a
Directory on nearly any disk or harddisk density in MyDOS or Sparta-DOS
format...

Alas, you can format a disk with 1440k (with Percom.COM), write the Dir.
sectors in MyDOs format (with FMTDIR.com) and finally write MyDOs to
this disk, but if you boot it then, MyDOS will refuse to boot/load from
this disk - thus you must patch MyDOS to work with 1440k (and at the
moment I don`t know how its done)... with Sparta DOs, 1440k is no
problem... greetings, Andreas.

Source record: 17709

Hi,

> Using this method, would I still be able to use my light gun/pen with a VGA
> monitor?

Unlikely, at least the horizontal position of the pen will be unusable, the vertical position *might* work. The VGA monitor has a 31Khz horizontal scan frequency, twice that of the regular Atari output. Since the light pen input just captures the the beam counters at the time the electron beam passes by, but that happens at a different time with the VGA due to higher frequency, the correspondence between beam counter and position is lost.

> I would think not due to the monitor having a zillion more color
> clocks & scan lines to it than a standard TV, plus the cheesebox adapting
> the signal would probably stop any chances of the Atari being able to figure
> out where the electron beam was at any given time anyways...

That's correct. The number of color clocks is less the problem, it would work if the monitor would operate at 15Khz horizontal - but that's out of the HSync range of VGA.

> Also, with that thought in mind, wouldn't that screw up programs/games that
> used artifacting?

Hmm, not necessarely. The color artefacting is a side-effect of the limited bandwidth of the color information encoding for the NTSC system. Now, the "cheesebox" has the same signal available as the TV, just not modulated on an HF carrier. Thus, it is not too unlikely that some artefacts are visible.

Here on the PAL system, the effect is less visible anyhow since the color clock is 5/4th of the base frequency.

So long,
Thomas

103. Re: Games that uses Atari 130XE memory?

Newsgroup: comp.sys.atari.8bit
Date: 2004-01-05 15:06:58 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3FF97D92.660E0713@students.uni-mainz.de>
Source record: 17710

Well,
I made this big list of programs that a) support (like alternate reality) or b) require (like some demos) extra Ram or ramdisk. the info can be found in michael current`s A8FAQ.TXT (Frequently Asked Questions) that is published here bi-monthly. take a look at 8.10, 8.11 and 8.12...

Besides Russ Gilbert has already described the bank control of a 130XE. On a 64k Atari there are still some programs that use more than 48k RAM, these are programs that use the RAM under the OS ROM (programs like Sparta DOs, Turbo Basic XL, TB Runtime, the 64k version of Mercenary, Thomahawk, and many many more). Of course these programs can only be loaded without Basic (hold down Option at boot-up) and with a program (most probably a Gamedos loader) that does not use this RAM under the OS for its own purposes...

Believe it or not, on a 64k Atari one can "turn off" the OS and then make up to 62k memory available (48k RAM plus 14k RAM under the OS) for his own program. Of course it is not possible to just turn off the OS - one has to install a new OS then (but this new OS can be much shorter)... So whenever a Commodore user says that Ataris merely have 48k RAM, I call them bastards - I don`t think that a C64 can use more than 62k RAM (it also has some kind of OS that wastes some RAM space)... greetings and no flame-wars again - Andreas.

Source record: 17711

Well,
Mercenary (hold down Select for 48k/fast version, hold down option for
64k/slow version; the 64k version uses RAM under the OS ROM!) and
thomahawk also use more than 48kbytes RAM, the SAP player for the A8
makes a lot of free memory available: $0200-$CFFF and $Dxxx-$FFFF (so it
can play most SAP files). of course there are also a lot of programs
that merely use the RAM under the OS ROM (TB XL, Basic XL, Basic XE,
Sparta DOS for example). but afaik there once was also a tape-copier
that gave you 60-62 kbytes free/copy memory on a 64k machine (it only
copied from tape to tape, but anyway)... I also remember some demos that
used 56-60 kbytes and worked ok on a 64k machine... -andreas.

> space)...

I'm not at all an expert in the C64 bank switching possibilities, but
if I remember correctly, the C64 could really make all 64K (minus two bytes)
available to the CPU, even masking out the memory mapped I/O. How to map
then without I/O space? Well, simple enough: The C64 used the 6510 CPU
(or rather, microcontroller) with two built-in I/O ports mapped at addresses
$0 and $1. Thus, it doesn't take additional hardware to bankswitch.

So long,
Thomas

(deja vu)
(When you try to view a directory, you get part of a file instead.)
I think that's what you said, and that you had the same problem
with a real atari.
It almost sounds like you're trying to get a directory of a SpartaDOS
disk with MyDOS or DOS 2/2.5.
Could you be more specific in describing what is happening?
I know of no utilities that will repair a bad disk image, especially
if you don't know what's wrong with it.
Maybe you could describe how you made the images.
Did you use an interface cable and sector copy disks to an
image on the PC? Or did you use some disk2atr utility?
Russg

I used to have an adaptor & board connector that allowed most 2600 games to be played on an 800XL. It was a homebrew project that I had somehow acquired. I remember it had a great deal of difficulty with the Activision carts though. I didn't use it very much. All my 8-bit stuff is still in boxes and I don't know if I still have it, but I'll take a look first chance I get.

Thanks!

I was doing something dumb, like using .com vs. .edu

The big symbol table is at
http://www.umich.edu/~archive/atari/8bit/Languages/Action/bigst.act

Like the blurb says, it doubles your symbol table size so you don't run out
of space when using the unedited RT package.

The RT package I preferred to use was Jeff Reister's, it is listed as
actrun.arc in the file section of
http://www.umich.edu/~archive/atari/8bit/Languages/Action/

I *couldn't* find the utility programs
RTSCAN.COM
RTWRITE.COM

If nobody else knows where they are, I will look for them around the house.
Most of my 8 bit disks kind of went for a swim while in storage and were
destroyed. I my still have a copy on a hard drive somewhere.

Well, I think that his games are a bit more rare than the .99 games from
O'Shea (? or do I remember incorrectly). If you can get me Motor Psycho,
Alien Brigade for 3-5 pounds, I take 5 of each, please!

But, I do agree that they are a bit overpriced. I got my Motor Psycho for
USD 20 and Alien Bridgade for USD 30 I think.

The attitude is a bigger deal to me, though!

Take Atarian care

That would be cool if done for an 800, I know I have hundreds of 2600 roms
I'd love to play on a real VCS. Plus it'd give the ability for further game
development without supercharger tape hassles. Not the same thing I found
though, I'll post a scan when I get a chance.

I know alot of disk images are programs that were converted to disk images. What was it? EXE2ATR something like that. Alot of images are short a bunch of sectors and when you try to copy them or transmit them they error out and fail. My solution when that happens is to use a sector copier like Diskey to copy the image from one to another, the result is a real image that will copy over or transmit 1050toPC. Not sure if that was the problem or not.

The disks I'm referring to are all disks that worked at one time, but
then became unusable because their directories got corrupted. They
contained Atariwriter (word processor) files. I know my Atariwriter
files are still on there, because when I use Sherlock (the Atari
program I mentioned before) I can view indivitual sectors and see my
files. But this is the only way I can get to them, and I really don't
want to go through every sector and write everything out by hand.

What I really need is some program that will let me specify a start
and end sector and then convert all the sectors into a text file.

Went to Office Max and found an almost perfect storage unit. It has six drawers that are 3" tall (same as an Atari PC cart), 9 1/2 " wide by 13 1/2 long. I can store 50 carts per drawer so storage of 300 carts no prob. They have on sale for $13.99, $16 bucks off the regular price!

I plan to put each cart into a sandwich baggie for extra protection.

Thanks for your feedback.

Paul:

I can't thank you enough! That did the trick - carefully cleaning the
mylar and the circuit board and now it's good for another 20 years. :)

There were a couple of spots that "ripped" as I was pulling it off, but
they were small and did not have any tracings on them (insulating
material).

Thank you again,

Jerry

I did not use the RF output, I used a monitor cable. There is composite in
which I plugged that into.
It's been a while since I've used it (probably 1+ years). I was thinking of
selling it. The colors look too pastel-like on a VGA monitor.

You have some disks, but the directory is corrupted.
What are you using to get the directory? I guess you are using
DOS. What DOS are you using? For instance, if you are
using DOS 2/2.5 or MyDOS to read the directory of a SpartaDOS
disk, it won't work.
There are programs to edit sectors on a disk, such as Diskey
or Disk Wizard II. Even programs to dump sectors to a file.
You need to tell us more about what you have, what DOS you're
using, what emulator you're using to access disk images on
your Mac, exactly what you're doing.
If it is a DOS 2/2.5 disk, you might be able to restore the directory,
but it isn't easy.
I forget the directory structure. It starts at sector 360 for DOS 2/2.5.
Has a VTOC, then the directory entries in 360+ sectors.
SpartaDOS has a completely different directory structure.

Sounds like the best step would be for me to use one of the PD runtime libs,
and write my own Action! FP functions to wrap the ROM functions. If I do so
I'll share the code with anyone who wants it.

The spartan wasnt a fake or vapour, it did exist, one of the dealers on queen street in toronto, who's name I've long forgotton (is also long gone) had 100 of these when mimic systems went bust. Active surplus across the street also had several hundred that they sold off as well, most of them being sold as scrap parts despite all of them being in working condition. Since I also had one for a while I can say for sure they did exist.

Message-ID: <2be33b6b.0401070817.3647a1c2@posting.google.com>
Source record: 17742

Hi all

I'm making a trip to the US soon (from the UK) which starts in New York, then flying to San Francisco and then to Los Angeles.

As a lifelong (well, almost...!) devotee of Atari 8bits I wonder if there's anywhere I can go in any of these cities that I might find bits of kit or software? Obviously I realise that each place is pretty big but what do you think? Thrift shops? Second-hand computer stores and the like?

Thanks for any advice
Jerry

136. Re: Repairing Disk Imaages

Newsgroup: comp.sys.atari.8bit
Date: 2004-01-07 19:01:44 UTC

Source record: 17650

Well,
if the disks are in DOS 2 format you can use Turbo DOS by (german)
Reitershan. This DOs has a built-in Diskfix program that will not only
repair "Error 164" disks, it will also repair most DOS 2 disks with a
bad and a partly destroyed/overwritten VTOC and/or Directory. The
function in this diskfix utility is called recover directory - the
program then scans the whole disks and marks start and end sectors. it
can also automatically find out if a file is Basic (*.BAS), ML (*.COM),
listed (*.LST) or text (*.TXT) format. when finished "scanning" the
program will report the number of files, their start + end sectors,
their extenders (it uses *.REC if the program source is unknown) and
other information. You are then asked to write a new Directory
(Filenames will be File01.*, File02.* File03.*, etc.) and VTOC (confirm
with Y or Return) and voila you have repaired and rescued a DOS 2
disk...

I already used this utility a dozen of times and it worked great !! One
can also use it to search for any files on a disk that otherwise appears
as a bootdisk (no dir entries) and sometimes it turns out that some
"bootdisks" really contain disk-files... Since Turbo-DOS works only in
DOS 2.x format, this utility can only find DOS 2 files (no DOS 3, DOS 4,
DOS XE or Sparta DOS files)... But therefore it also contains at least a
DOS 3 and DOS 4 converter... However the max. disk density for Turbo DOS
is 360kbytes - the same counts for the diskfix utility. E-Mail me at
amp<no-spam>@abbuc<no-spam>.de or simply use the e-mail adress that
appears in the header of this posting... greetings, Andreas.

Message-ID: <3FFC5DC8.F4FCFBBF@students.uni-mainz.de>
Source record: 17651

Well,
maybe if you have some bad luck with old emulators or old converters, it could be, that the images are DD and do have the DD-image bug (e.g. 183,952 bytes versus 184,336 Bytes in 180kbyte format). In double density format *normally* only the data sectors are double density, whereas the boot, vtoc, directory sectors are *normally* only single density (alas, there are exceptions - some DOSses use DD directory sectors for 128 file entries). Meaning, the Atari (its OS!) will only accept the boot sectors in single density - and thus the floppy drive or emulator has to send the first 3 sectors with 128 bytes each (3x 128 = 384 Bytes, the exact difference between 183,952 and 184,336 Bytes), otherwise you will get a boot error. If the emulator sends 256 Bytes for each boot sector, the disk will not boot and furthermore it might also happen (if you copy this disk onto a real Atari 5,25" disk) that data/VTOC/Directory sectors get corrupted...

Yes, emulators are a little wierd/weird (?) with double density Atari formats. Sio2PC saves DD/180k with 184,336 Bytes but luckily sends each boot sector in single density (so DD images will boot fine with SIo2PC). Some older versions of Atari 800 merely acceppted the shorter 183,952 Bytes DD/180k disks and refused to boot or load any SIO2PC created images - but newer versions of Atari 800 accept both formats...

There might also occur problems with Ataridsk and WriteATR (both by HiasSoft!). When you copy some files with Ataridsk from PC to Atari disk, it does not count the number of files - and if you are really lucky, and all your files are extremely short, it might happen that you select more than 64 files and the program also copies more than 64 files to the Atari disk, therefore destroying data sectors. With WriteATR you can read Atari disks in 180k, 360k and 720k in many different floppy modes and then create ATR images on your PC. If I remember correctly, the program will (always) only read up to 64 files per Directory. But, in Turbo-DOS, Bibo-DOS (and some other DOSses) it is legal to use the Directory of a 360k disk with double density and thus store up to 128 files on such a disk. WriteATR will not be able to read all these 128 files, since it assumes, that the dir sectors are only single density... Just some wierd thoughts... greetings, Andreas Magenheimer.

you know what, now that I think of it... I didnt pay 175 for it back
in the day... You've gotta wonder who IS paying that price?

refurbishing generally means restoring to like new condition.

Hi Jason,

With my 130XE,

monitor port->chroma/luma cables->S-video->CheeseBox->VGA

was WAY better than

monitor port->composite video->CheeseBox->VGA

which also also very good.

I admit, I'm not sure I'd seen the Atari's separate chroma/luma signal before this, but really, it blew me away how sharp the VGA picture was when connected via s-video through the CheeseBox.

Heh... In some ways, the little Atari is more powerful than some of these phones. Not that I've gotten into raw assembly or anything (probably not possible due to certification issues), but I'm using C and some things are still VERY slow. I can't use neat tricks like DLIs and VBIs. :^(

But, the horsepower of the CPU _usually_ makes up for it. I think most developers working on these phones have the same issues, so at least my games don't end up looking _too_ slow or lame, compared to what else is already on the market. ;^)

My latest game will probably be the first to be published. Hopefully by February!

The Black should be standard composite video.

This same cable was used for the Commodore 64, but different color plugs were used.

The Atari's did have "soul". They were just plain fun too. Simple enough
that you could understand and know EVERYTHING about them yet powerful enough
to be interesting.

Funny thing too is that since the Atari days the only game to really capture
my attention and make me love to play was Halo on my XBox....

Here's a related comment and question about ATR's.

First, I have found that some "ATR's" are actually XFD's, which naturally offsets everything by 16 bytes. Easy to diagnose though, by looking at the start of the directory sectors. And APE will not accept an "ATR" that is really an XFD, although some emulators accept either and don't care about the suffix.

Second, I presume there is a format or protocol for "short ATR's"? Those being the ones that have a lot of blank disk space that has been removed. Any info on how those are created?

Larry

any1 got xex2cas converted xex files to work with atari800win emulator only
i cant get them do anything but come up with a error or if i try and boot
them the tape stops and nothing happends.

cheers
ian

Yes and a big Sieg Heil to you too.

I don't know what brought on this rant, but I don't think Bruce had any
intention of emigrating to the UK.

I already knew racists were stupid enough to blame all foreigners for
their own problems, but even jumping on someone when he says "I'm in
Chile" is even more stupid than I'd ever imagine people like you to be. :)

What I fail to see is what your nazi talk has to do with eBay or Atari.

Have you got one final excuse before I post a complaint to v21?

Maurits.

Good question! You'd think someone has pissed in his coffee or
something by the response he posted. Then again, if that is how he
he treats people, I hope somebody does piss in his coffee!

Try this site for information and source codes to making kboot images 'ATR'
http://home.earthlink.net/~atari8bit/a8emulators.html
Basicly the boot sectors point to the only file stored on the disk, and all
other sectors are removed from image.

This page tells about the header for ATR format. To change an XFD to ATR
add this header.

http://www2.asw.cz/~kubecj/afmtatr.htm

This old thread on Google groups is about the K-boot and Makeatr stuff

http://groups.google.com/groups?hl=en&lr=&ie=UTF-8&threadm=ef53b03c.0202130851.7f04050b%40posting.google.com&rnum=1&prev=/groups%3Fq%3Dkboot%2Batr%2Bgroup:comp.sys.atari.8bit%26hl%3Den%26lr%3D%26ie%3DUTF-8%26group%3Dcomp.sys.atari.8bit%26selm%3Def53b03c.0202130851.7f04050b%2540posting.google.com%26rnum%3D1

This xlsearch for makeatr might help also

http://www.newbreedsoftware.com/xlsearch/xlsearch.cgi?keywords=makeatr&sortby=Name

The previous post about this process is on Ken Siders web page seems to be a
broken link.
There also other utilities that help you do this process.

Regards
RoyE

167. My success with 800xl on my PCs monitor.

Newsgroup: comp.sys.atari.8bit
Date: 2004-01-09 01:52:02 UTC
From: "Z.Beeblebrox" <the.z.guy@comcast.net>
Message-ID: <fNWdneE5MvHdlGOi4p2dnA@comcast.com>
Source record: 17674

Thanks to all of those who gave me input on this topic.
I now have my 800xl hooked up to my PCs monitor.
Combine that with the sio2pc cable, and I don't need the atari disk drive either.

So, it works pretty well.

I picked up a cable for the 800xl that goes to its monitor port.
On the other end of the cable are RCA-style plugs. The sound one I run to speaker.
The video one I plug into my new "cheesebox" which then runs to my PC's VGA monitor.
The cheesebox is like a video switchbox. Like an "A" or "B" input device that shares the same output (pc monitor). a=my ibm PC, b = 800xl.

hey gang -

Is there a version of SIO2PC that you can run in Windows? If I don't boot from a DOS disk then this program won't work for me. I'd love to stay in Windows!

Or maybe there's another program I can use to emulate the atari disk drive???

Your two best options are either Atari810
(http://retrobits.net/atari810.html) or APE (http://www.atarimax.com/).
I personally use Atari810 for two reasons:

1) I've never been able to get APE to work.

2) Atari810 is free.

Although my experience hasn't been too good with APE so far, I know that
plenty of people in the A8 community swear by it. I'd suggest looking
into both of those options and see what works best for you.

APE and the PC mirror option is amazing. I set D2: as PC mirror. I have
been able to fine tune my hard drive for Atari and Blackbox. One directory
mirror for SpartaDOS and another directory for Mydos and AtariDOS 2.5..
Atari810 is awesome also now that I have all my ATR's in a row..
I have recently found another SIO2PC program called ARFD 1.91 that I am
still working with not much luck tho ..... Too many options. This is
bundled with a nice Monitor program for windows, Im still tring to figure
this out also.

Hello, 8-bit friends,
My article on the December 30 Micro-Palooza C= Party is still a
few days away. However, in lieu of that, here is a December 25 article
from the Portland Mercury newspaper that previewed the show.

Truly,
Robert Bernardo
Fresno Commodore User Group
http://videocam.net.au/fcug
------

microPALOOZA
Tues Dec 30
Ground Kontrol

MUSIC

Wiggle It, That 8-Bit

Music for the Video Game Enthusiast by Julianne Shepherd

IT'S NOT A FESTIVAL of minimal tech-
no, exactly. MicroPALOOZA, a daylong 8-
bit party at Ground Kontrol Retrocade, cel-
ebrates micromusic, or "chip":
music created using similar instru-
ments as the soundtracks in early
video games. It's micro in sound--
pixilated compositions using a single pool of
tones--but macro in size, coming from big,
clunky unwieldy machines like Game Boys,
Commodore 64s, Ataris, synths as big as a
house. Micro may consist of funky, teeny
analog dance floor rhythms, yet it takes on
the glowing keen of old video game sound-
tracks. In this music, the blurpy sonic
ghosts of Dig Dug, Pac-Man, and Space
Invaders lurk behind every melody.

Los Angeles Seth Sternberger is
known as Nastyboy on micromusic.net, the
internet community that acts as a hub for
micro composers worldwide. He's been
making micro for about four years
under the moniker 8-Bit Weapon,

and his current rig includes two Commodore computers--a 64 and a 128--and a cartridge of sounds, controlled by an old Pong paddle. Though some micro enthusiasts are too young to even remember Nintendo, much less Pong, Sternberger says, "One thing that draws people to micromusic is the nostalgia of the video games--taking these nostalgic sounds and making new music, with modern beats. The overall vibe is fun, so it's a really good community. You gotta have that fun, open, kid attitude."

On micromusic.net, you can listen to microradio, choosing from categories like "funky, sporty, worky, spooky, relaxy, lovely--which either sound like the Gus Van Sant remake of the Spice Girls, or varying levels of Donkey Kong. According to Lodus (nee Adam Chronister), "I think what's really appealing about micromusic is that it's not super-inaccessible; you don't have to buy a thousand-dollar synth to be a part of it. You can get Nanoloop and buy a Gameboy for five, ten bucks."

Lodus recently released We Are The Toybreakers (miniature records), a micro-album created with self-made instruments and bent circuits. "I grew up picking apart the toaster and trying to figure out how it works," he observes, "but I never applied it until I picked up THUMB zine #10. They had an interview with Octant and Solenoid and Amps for Christ; it really drew me back towards messing around with electronics. At the time I was working at a thrift store, so finding keyboards was no problem."

Micro's popularity has been on the upswing since the invention of SIDplay, a program that emulates the SID chip--the chip responsible for all those video game scores. In 2002, under the moniker Brotha P Touch, SF musician Lesser released C64 Massive SIDplay (Tigerbeat6), a SID music flagship release. Still, despite some coverage in Urb and The Wire, in America, the micromovement remains largely underground and internet-based. As Lodus

describes it, "I guess you could say it's just a gigantic network of home musicians. A lot of the micro events and festivals are very small." As such, microPALOOZA is the first expansive microevent in the Northwest. At 1 pm, the Commodore enthusiasts will convene, a legion of 64s in tow; the music begins at 6 pm, and will include 8-bit Weapon, Lodus, MOS-8, gotoXY, and Waxin' Wary. If you bootleg it, use a DAT machine; anything newer could sully the vibe.

December 25, 2003 Portland Mercury p. 15

Source record: 17680

I purchased and use Ape from Windows (because I loathe any type of DOS software). This software is excellent although there are a couple of drawbacks...

1. The shareware version is crippled and costs $50 to register and is a bit too expensive in my opinion. But the software does work great so you have to decide if the value is there for your particular needs. I stewed over this for months before I finally decided to spend the money. I am not a frugal person at all but it is priced high enough that I was not comfortable buying it. It really should be around $25. IMHO.

2. One pet peeve I have had about this is that I don't know how all the features of the software work. I have been waiting for the online documentation to be finished so I can fully use and understand all the features of what I spent $50 on... well, there has been a "Coming Soon" link there for over 3 years. :(I have to admit that I am not terribly pleased about this.

This really is an awesome program though, Steve (the author) did a really good job on it.

Anyhow, just my two cents worth.

ARFD will not work with SIO2PC cable.
ARFD requires slightly different cable design, something ala ProSystem cable
for APE/ProSys; it is usually referred to as 1050-2-PC cable.

Hi Roy-

Thanks for the new links. I found the info and I'll have to "digest" it. I'm very familiar with the regular ATR's, and in truth, it doesn't really pose any problem to use a "full-sized" ATR -- mostly just curiosity.

Regards,
Larry

Sounds pretty good to me. I have the same type of setup using the
SIO cable only I use my Atari clone (Hades060) as my 8-bit drive.
Nice to not have to rely on the 8-bit disk drive. Those 8-bit
disks are like gold to me and I do not want anything to happen to
them.

I seem to remember Protecto (I think) running ads in Compute back in
83-84-ish about a VCS adapter for the Vic20. Doesn't mean it was ever made
but then again their 80-column boards and speech synthesizers were made but
are very rare. More than likely though they got scared of Atari and dropped
the product. :)

Yep. It is pretty much this one I'm talking about. It might have existed as a prototype, but surely Compute or someone else would have picked up one and made a short review, even if both the VIC and Atari 2600 were "old news" at the end of 1983.

Maybe it was just a development adapter like the one mentioned here, to use the computer as a storage device to the console.

Well,
afaik there is a programm called Atari 810 which does that. There is
also atari File management (AFM by Burkhard Rau) which works the same
way... try to search and find them. I don`t know if any of these do have
any docs... greetings, Andreas.

There's no shame in booting into DOS, I did that with the SIO2PC 4.19
program for about three years with no complaints. It handled any .atr I
threw at it and did a lot of other functions as well.

I finally got APE for Windows 2000 though mainly because I bought around
$200 worth of hardware and carts from Steven and decided to go all the way
:-) He's done some awesome work with APE, WarpOS+, and the new Flashcarts
so it doesn't hurt to support the effort at www.atarimax.com

Steve also has a program called Imagic for windows that will convert XFD files to ATR with out effecting the original file. Imagic duplicates the file and addes the ATR header needed to run with the APE program. XFD files should never be a reason not to have a SIO2PC setup to run files from the PC. APE and Imagic are shareware and crippled somewhat until registered, but I used them both for weeks unregistered.

I downloaded Imagic from Steve's site, but it doesn't look like it has the
capability to convert xfd to atr or vice versa.
I was just using it, and can't seem to figure out exactly what it does.

Under ATR, you can only view .atr files, and if you go to save/new, you can
only choose ".atr"
same with .xfd.....so I don't see how you're suppose to convert them.

Z-

There are 4 windows: Examples
window 1: direct this window to a folder 'directory' for the needed disk
type
and do this for all windows 4 folder 'directorys'. Copy the files needing
conversion to these folder xfd -> C:\atari\xfd 'example only'
dcm - C:\atari\dcm 'example only'
ETC...

```
-------------------------------------
| ATR <-|-> DCM |
| | |
-------------------------------------
| XFD <- |-> SCP |
| | |
-------------------------------------
```

Mouse click drag XFD to needed conversion window

This again probably doesn't come with a Manual of operation, but after
floundering around for several month with the Shareware version... I bought
the REG: version, but it's the same as the shareware with out the crips

Hope this example helps.. Remember Left click mouse file in window and
drag. All windows can look at the same folder 'directory'.

I appreciate your response.
I'm sure if the program can do it, I'll figure it out.
My first attempt[s] didn't get me anywhere and I didn't have a lot of time
to play with it.

193. Atari XL/XE/Lynx Emulator for Color Palms exist?

Newsgroup: comp.sys.atari.8bit
Date: 2004-01-11 10:37:12 UTC
From: mstepansky@aol.com
Message-ID: <20040111053712.26136.00002460@mb-m15.aol.com>

Does anyone know of such Atari emulator to play 8-bit game (XE/XL) and maybe 2600 games and Lynx on Color Palm PDAs? Which PalmOS versions? Where to find it?

Mike

194. wms/midway and atari h/w patents

Newsgroup: comp.sys.atari.8bit
Date: 2004-01-11 15:50:11 UTC
From: carmel_andrews@hotmail.com

understand that during or after the Atari/JTS merger, atari ofloaded the hardware rights and patents to WMS (who also acquired atari's coin op division as part of the deal)

Additionally that reason why Hasbro/Infogrammes aren't using the atari name on hardware is because, they only have the rights to using the atari name for software (is this true)

If the former is true, I am surprised that no-one has thought about aproaching wms/midway about doing some sort of deal with them in relation the sharing the patents/copyrights to ALL atari h/w technologies (all lines, console, computer and coin op.)

I say that because, before Tramiel reverse mergered Atari with JTS, atari was doing deals with 3rd party EU and Canadian h/w developers (the best known one I remember being C-LAb) allowing them to legally manufacture and produce 3rd party versions of Atari hardware (but not allowing them to calling the models/products Atari)

Now, as I understand it, some of these developers still exist today, the one that i've heard of is Milan (or was that the name of the computer)

Now assuming that WMS are still the legal owners of the h/w patents/rights, and because they're sitting on these patents/rightts without doing anything with them, surely as wms is a commercial concern it would be in their interest to try and make as make as much money (and mileage) out of their Atari interests, then what is presently occuring

And assuming that infogrammes are making some success in using the name Atari for software products (considering atari's previous record at attempting this type of business enterprise), because Atari is a name known to most people as a manufacturer of h/w, surely it doesnt take someone with an mba in Sales/Marketing or business managememt, or a PHD in rocket science to duplicate this success in h/w products, as infogrammes have done in software

All WMS would have to do is share out the h/w patents/rights (all product lines) to the above developers, allow them to use the name Atari on the finished product (the develpers incur the manufacturing/production cost), and also wms share marketing costs, and deal with distribution, wms get a percentage per unit sold for access to the patents/rights and also distribution costs, the developers get a significant percentage to cover joint marketing costs (as well as manufacturing and production), and instead of distributing

to middlemen, who then deal with the retail/computer dealers etc, wms will sell direct to the retail/dealer trade and also direct to corporates/consumers thru their online presence

After all, Tulip computers are trying the method with a london based company in regards to their commodore h/w patents (their trying to release a new version of the 64 apparently)

I am guessing that their is still a lot a marketability in the Atari name, and also a heck of a lot of mileage in the Atari name, in would be beneficial for wms to allow the existing developers access to the relevent h/w righrts/patents, allow them to use the name Atari on the finished product, get a decent distribution system in place, and bobs your uncle

After all according to tulip/ironside, their are supposed to be 300 commerical websites dealing with former commodore h/w, I'm pretty sure that there is a similar number of comm. websites dealing with former Atari h/w (if not more)

And assuming that most commodore users come over from Atari, as also pertaining to pc/mac users, which means that there already exists a ready made market for these potential customers

And I would assume that the same applies to nintendos, sony, sega and m/s xbox users, having come over from Atari, again a ready made market for these potential customers as well

The only market the the 'new' Aatri would need to Attack is those new to computing/games looking to buying an established brand (you cant get any more established then ATARI... unless I'm wrong), or alternatively those consumers looking to upgrade or get a better system from an established name

I bring this up because If you look at what Atari actually designed, created (in the years as h/w manufacture), atari wasnt designing technology for technologies sake, it was designing technoology the had something intrinsynchly 'Atari' about it/built into it, essentially Atari wasnt designing technology peroid.. It was designing 'Atari technology'

To proove a point, take the xbox, ps1/2, or gamecube, look at the technological asptects (USP's) of these systems, if you trace back these technologies early enough, you will no doubt arrive at a design concept or technology the Atari invented or pioneered

To proove the point again, if you look at a modern OTS (of the shelf) PC
and put it up against a modern adaption of the Atari 800, you will find that there is very little difference

I.E, pc is plug and play, Atari 800 was plug and play (I.E separate graphic/sound boards, sepaerate cpu board etc

It's very easy to replace the processor in a pc, as it is in the 800

the PC has USB, which is a simplified at newer version of SIO (atari 800)

The PC uses plug in memory modules, the Atari 800/400 pioneered this

The PC uses separate sound/graphics cards, as did the atari 800, further more the concept of the PC sound/graphics card was a development from Atari's Custom Chip design techology

Also Atari had or feartured the first modular or expandable/replaceable o/s, beating thing like linux/windows by years, whereas o/s's suppled by other manufactureres were hardwired or burn't in

To look at it another way, if atari hadn't existed (and therefore the resulting techologies not created) if you had a pc, xbox, ps1 or 2 or gamecube now, all you wouyld have is a cdrom drive, a box with a logo on it, and a pcb without h/w onboard, and therefore wouldn't be much of an investment

And essentially because all this technology can be traced back to something that Atari created invented or pioneered, all the consumer is buying is Atari techology in someone elses box, would'nt you rather buy Atari techology in an ATARI box sold/marketed by ATARI (because you are already using their technology)

After all as all this technology can be traced back to something that Atari designed or created/invented, no company can claim to be more technologically more advanced than Atari, even if the new/latest technology developed is an advancement on Atari technology, because you are still using Atari techology to develop this new techology, essentially you cannot (can't) OUT-TECHNOLOGY Atari (as they developed most/all the techolongy that this posting refers to)

So in a nutshell sony, m/s, nintendo and those that manuf. macs and 'ots' PC's may be able to out advertise, out market and probably outsell Atari, but the key USP that Atari have, these other manuf.'s cannot (can't) out technology Atari, and thus they have no over riding advantage over Atari, technologically speaking ofcourse (so there's no technologically binding reason why you should buy these other formats/platforms or systems)

Perhaps I should'nt be asking that particular question on this forum

Any sugestions... give me an email

Atarily yours

Warner brothers did not sell the coin-op division of atari to the
tramiels to begin with.

>Additionally that reason why Hasbro/Infogrammes aren't using the atari
>name on hardware is because, they only have the rights to using the
>atari name for software (is this true)

this isn't true. Hasbro had the rights to the atari computers,
videogames etc.. they even allowed third party's to develope and
release game cartridges for the Jaguar. They have no interest in
hardware and what atari had at the time of their demise (jaguar and
falcon) weren't excactly setting the world on fire.

the rest of your message I dont really agree with. While someone
could make a modern "atari" style device (whatever that is) it would
be lacking in two areas (1) software (2) users.

US patents only run 17 years. For instance, one of Atari's pantents was
using 4 bits to encode an 8 direction joystick. Virtually everything that
Atari did hardware wise is now free for the taking, i.e. if you wanted to
manufacture a JS based on the Atari patent, you could.

Copyrighted material is a different matter of course, but even that seems to
be changing.

Don't think there are any. But there is a commercial one for some Atari
2600 games.

Well,
simply use an ATR => XFD converter, like XFD2ATR.EXE by E.Schreurs, ACVT
by Jindroush, Imagic by Steve Tucker or any other XFD converter...
greetings, Andreas.

Alternatively, if you're under Window$, you can use Atari800Win PLus 4 for
coversions (under menu Misc -> Convert -> XFD to ATR).

Well,
there are two (or more?) versions of Imagic. One runs under DOS, the
other one under Windows. I use the DOS version and converting goes
somehow like this:

IMAGIC *.XFD /ATR (maybe it is \ATR)

This should convert all XFD images into ATR images. Note, that imagic
will copy/save the target files (here: the ATR images) into the dir.
where you started Imagic from. If you use XFD2ATR by E.Schreurs the
process is even easier, just type: XFD2ATR *.XFD and it will do the job
for you (under DOS). With ACVT you have to have another program called
...DPMI.EXE then you type: ACVT -autorepair -batch -ATR *.XFD and voila
it will convert all XFD images into ATR and even repair them for you (if
there are any errors)...

Afaik none of these converters will handle "too short" XFD or ATR images
correctly. Meaning, if someone saves a 16k file as an 18k XFD or ATR the
conversion will have the same short size (+/- 16 bytes). To get rid of
this problem do the following: first convert the shortened XFD into ATR,
next execute SIO2PC and install a sector copier that will continue
reading (!) when Errors occur (Mycopier and others can do that). next
boot this sector copier, then uninstall it and install the "shortened"
ATR image. Now copy the short ATR image onto a real 5,25" Atari disk.
The copier will read the data sectors and after a while tens or hundreds
of errors occur - don`t worry, the sector copier will write out empty
sectors for them. And thats exactly what the original ATR image
contained, some data and tens or hundreds of empty sectors. The copied
program on your 5,25" Atari disk should work now... Make sure to boot or
load it correctly (as a bootdisk with/without Basic; as a file-disk with
DOS or Gamedos and with or without Basic, etc.) Good luck... -Andreas.

Well,
the Atari Jaguar came out 1993 - if patents last 17 years, there is
still some patent on Atari Jaguar at least (and most probably of the
Falcon also)... greetings, Andreas.

P.S.: Afaik, patents last much longer here in the EU or at least in
Germany...

true, you must write your software with the little screen in mind,
also the limitied memory and disk space of the portfolio must be
considered. I'm just saying an "emulator" is not necessary, because
the portfolio is ms-dos compatible.

Hey 8bit gang -

I was recently browsing through some of my favorite basic programs and
I stumbled onto an error I recall (rather well) from the 1980's.....

You type [in basic at the prompt]:
LOAD"D:PROGRAM.BAS"

and the 8-bit responds by saying:

READY

READY

....and POOF! Your program is not loaded and will never load again.
Go ahead, type "LIST" I dare you! Because nothing is there.

I'm too many years removed from this stuff....do you recall why that
happens or if there is a fix?

-Z-

Hi, I'm Ben Smith, proprietor of Bravo Sierra Computers! I'm an Atari Dealer/Reseller who occupies a unique niche in the Atari World! Most Atari Dealers stick to just selling NEW, I also sell Used/2nd Hand Atari Goods! So not only do I sell NEW Atari Goods at a competitive price, I also sell used Atari Goods you may not be able to find anymore at Swap Meets, Thrift Stores or even Auctions Sites! And I sell for less! And unlike those who will remain anonymous! I test Goods before I sell them. So not only can I sell you some Great New stuff! But I can sell you hard to find 2nd Hand Goods, partly because I'm the guy most people come to when they want to give their Ataris a New Home! I'm saving Orphaned Atari's from Oblivion! Goto http://BensCatalogs.Atari.org or Call (503)256-9974! I'm not asking a lot, I'm just trying to make a living and I'd like to earn your Business!

http://www.aracnet.com/~atari/shipping.htm How I can save you Money!
http://www.aracnet.com/~atari/whybuyben.htm Ben's References!

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. Customers love the speedy service! I have lots of Atari SoftWare & Books. Which I can send by Media Mail Rate!

Please Direct all Replies Through E-Mail to: BenSells@Atari.org or Atari@aracnet.com. If you can't reach me, see my info at the Bottom!

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/ Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at http://BenSells.Atari.org Catalogs can be attached to,Requested by & Received Through E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

I don't know the url for the German patent office so I can't tell if it was even patented in Germany.

Usually countries honor each others patents so they are filed in only one country. There are some exceptions of course, but they have little impact on the situation. For instance, I think I have a patent in Finland for a veterinary device to be used on raindeer. IMHO: It was just our patent lawyer joking around and was never of any commercial importance.

Michael, I'll have to give that a try.
I can pick up a cable that converts the 2 RCA-style jacks to S-VIDEO
then plug that into the cheesebox.

Actually, the composite video thru the cheesebox is just a slight bit
blurry.

-regards,
z

I know someone out there will know this... I used to have a jumper inside the drive to bypass the write protection... But don't remember where it goes! I do know that it goes on the multi-pin connectors that inside the left rear of the drive, but that's about it. :)

Appreciate the help - thank you in advance...

Z:

As I remember (and it's been a long time!), that is the result of a BASIC program that has been protected to keep it from being listed... Meaning you have to use RUN "D:PROGRAM.BAS" to get that application to work correctly.

HTH,

Jerry

Good point! You have to connect the two pins of J11 between them, that's all.

I recommend you to install a switch to make the connection, with a led indicating that it's working. In your email I will send a diagram to make it. (It's in spanish, but it's not diffcult to understand). You will need:

- A two-position six pin switch.
- A 270 Ohms resistor.
- A led.

If you have any questions, please use this newsgroup, cause my e-mail is not working properly.

Greetings

Wilheim.

This is how I remember it also. Corruption of the name table in the
BASIC file causes this too. There is a BASIC 'deprotector' by Alpha Systems
out there somewhere which can re-insert the variable names into these files
and make them listable again.

The original variable names are gone, but you end up with a bunch
of new variable names like N0$, N1$, N2$, etc.

Steve

Yes, you're correct. I recall that as well.

BUT in this case, no. I wrote the program[s] in question. There's no list protection or anything of that nature.

All us Atari Dealers in the U.S. are hurting right now. Were the last ones
to feel any Financial Relief. Others say the U.S. is going through a
Recession, but for us. It's a Depression. Both financial and emotional.

Wilheim -

I received your email - very easy to understand, and I thank you again.

Best regards,

Jerry

"Wilheim" <guillermo@mail.cl> wrote in message news:btv42aflh1@news1.nivel5.cl...
Good point! You have to connect the two pins of J11 between them, that's all.

I recommend you to install a switch to make the connection, with a led indicating that it's working. In your email I will send a diagram to make it. (It's in spanish, but it's not diffcult to understand). You will need:

- A two-position six pin switch.
- A 270 Ohms resistor.
- A led.

If you have any questions, please use this newsgroup, cause my e-mail is not working properly.

Greetings

Wilheim.
"Jerry Trickey" <j_trickey@cox.net> escribió en el mensaje
news:0sDMb.350$Xq2.69@fed1read07...
One more "dumb" question - do I just remove J11 from the socket, do I have to jumper it to another pin? I remember in the past that I had a "U" shaped piece of wire that I would jumper between two of the pins in the plug...

Thank you very much,

Jerry

You have to bypass J11.

Hope it helps,

Wilheim
"Jerry Trickey" <j_trickey@cox.net> escribió en el mensaje

I know someone out there will know this... I used to have a jumper inside the drive to bypass the write protection... But don't remember where it goes! I do know that it goes on the multi-pin connectors that inside the left rear of the drive, but that's about it. :)

Appreciate the help - thank you in advance...

I don't know Ben from Adam, but here's what I will say about my brief
experience with him.

I wrote to ask if he had a replacement keyboard for my 1200xl. He indicated
that he didn't, but offered that he sold a couple of the other XL machines
or an XE system. When I emailed him back indicating that I had fixed my
keyboard by cleaning it... He did something that few vendors do nowadays -
he wrote back congratulating me on my success, and asked me to keep him in
mind if I needed anything.

That 30 seconds he spent doing that goes a long way with me. I've dealt
with plenty of vendors of electronics, on purchased from $2.50 to $25,000 (I
work in information technology), and I distinctly get the impression that he
cares about customer service. If the opportunity arises in the future, he
will get my business.

Everyone needs an "attaboy" every once in a while... Hang in there Ben, the
economy and our country will continue to get stronger and your business will
pick up...

Message-ID: <OcKMb.432$Xq2.106@fed1read07>
Source record: 17637

Hi gang,

I'm cleaning out some of my collection - here is what I have for sale:

Title Volume Publish Date
Antic Volume 4, Number 5 Sep-85
Antic Volume 4, Number 12 Apr-86
Antic Volume 5, Number 3 Jul-86
Antic Volume 5, Number 4 Aug-86
Antic Volume 4, Number 3 Jul-85

Title Publish Date
Atari Connection Fall 1983

Title Issue # Publish Date
Analog Computing 44 Jul-86

Title Issue # Volume Publish Date
Compute! Issue 46 Volume 6 Number 3 Mar-84
Compute! Issue 47 Volume 6 Number 4 Apr-84
Compute! Issue 49 Volume 6 Number 6 Jun-84
Compute! Issue 50 Volume 6 Number 7 Jul-84
Compute! Issue 52 Volume 6 Number 9 Sep-84
Compute! Issue 53 Volume 6 Number 10 Oct-84
Compute! Issue 54 Volume 6 Number 11 Nov-84
Compute! Issue 55 Volume 6 Number 12 Dec-84
Compute! Issue 56 Volume 7 Number 1 Jan-85
Compute! Issue 57 Volume 7 Number 2 Feb-85
Compute! Issue 58 Volume 7 Number 3 Mar-85
Compute! Issue 59 Volume 7 Number 4 Apr-85
Compute! Issue 61 Volume 7 Number 6 Jun-85
Compute! Issue 62 Volume 7 Number 7 Jul-85
Compute! Issue 64 Volume 7 Number 9 Sep-85
Compute! Issue 63 Volume 7, Number 8 Aug-85
Compute! Issue 65 Volume 7 Number 10 Oct-85
Compute! Issue 66 Volume 7 Number 11 Nov-85
Compute! Issue 67 Volume 7 Number 12 Dec-85
Compute! Issue 68 Volume 8 Number 1 Jan-86
Compute! Issue 69 Volume 8 Number 2 Feb-86
Compute! Issue 70 Volume 8 Number 3 Mar-86
Compute! Issue 71 Volume 8 Number 4 Apr-86
Compute! Issue 72 Volume 8 Number 5 May-86
Compute! Issue 91 Volume 9 Number 12 Dec-87

The magazines range in good (some marking and cover damage) to excellent.

I'd like to sell these all in one shot, so I would say the best offer over the next couple of days would get 'em. If someone were to offer $40 plus shipping it would be a done deal and would make my wife happy. :)

Please email with any questions you might have - thanks!

Uhm. Could be the BASIC 'B' bug, too many saves.
Jindroush has a PC program to recover the file to a list file.
So do I, but for the A8.
Can't remember the names. Mine is SALVAGE2.BAS and
SALVAGE1.BAS, one recovers the original variables, if they
are there, the second substitutes variable names where
they have been removed. Maybe Google jindroush and
get his page.
```

You are describing a defective program, not that you wrote it wrong,
but that something has happened to it in the round trip from Atari
to disk and back. I can confirm the unlistable and unusable Basic
state at that point until the next reboot. Only cure would some
highly skilled use of a disk editor and manually repairing tokenised
basic as stored on disks. Not something I was ever qualified to do.
Any takers?
Perhaps in these later days we should all attempt to save our Basic
programs as Atascii listed files? We could at least read those and
maybe guess at what was in between the lost forever gaps?

> Any takers?

I've here a basic de-tokenizer program that might be able to repair the problem. It is itself a (Turbo-)Basic program and can fix variable tables and broken line linkages (the most likely reason why a program goes corrupt). Maybe that helps a bit.

So long,
Thomas

Hi there,
I'm in Bristol

No very early no's for Anitic just: vol 4 no's 2,3,5,6,7 and vol 3 no's
9,10,11.

Analogs.... issue's 15,17,18,20,21,23,24,25,26,27,28,29,30,33,34,37
38,40,41,42,43,44,45,46,47,48 and 52.
Most are almost mint having been in binder since I got them.

I've also found 'The Atari XL handbook' Atari dos ref manule and the
Logo source book (for the ST).

Open to any offers for bit or the lot (bear in mind, in bulk the mags
are quite heavy for posting).

Hi!
I've sent a mail to you.. but i'm going to ask here as well...

Which payments methods do you take ? I'm from Chile, but the shipping would
be to a mailbox on Miami, Florida.
Paypal ?

Thanks :o)

Message-ID: <ec1749c9.0401130808.7935a7f5@posting.google.com>
Source record: 17550

Yeah, me again. Like Columbo, I never seem to go away and always have just one more question.

There's some talk of s-video on other threads, but I want to confirm that I understand it:

Now that I have a monitor cable for my 800xl, can I use S-VIDEO?

I have the monitor cable that has 4 RCA-style jacks at one end, and plugs into my 800xl at the other end.

Currently, I just plug one RCA into my cheesebox for video, and 1 plug into my PC speakers for audio. That works. But the video could look nicer.

Maybe I can use the S-VIDEO port on the cheesebox for a better looking screen.

Are those 2 "unused" RCA jacks coming off of my monitor cable the one's I can use for S-VIDEO? As I said already, I know which one is "audio" and the other I use for plain old "video".

muchas gracias in advance,
z
[aka Rob]

I have sent the money in US dollar bank notes in an envelope when I
bought stuff from Ben Smith.

Just use insured mail and you will be fine. Bank notes in letters are
often illegal and insecure but if insured perfectly OK.

Hi, I am in the UK and have a magazine article which describes in detail making a switched control with a 2 colour LED on the drive front for write protect/enable. I would happily send you a copy if you wish, easy to make and simple to fit

Richard
"Jerry Trickey" <j_trickey@cox.net> wrote in message news:bcCMb.288$Xq2.32@fed1read07...
I know someone out there will know this... I used to have a jumper inside the drive to bypass the write protection... But don't remember where it goes! I do know that it goes on the multi-pin connectors that inside the left rear of the drive, but that's about it. :)

Appreciate the help - thank you in advance...

Jerry

o.k. thanks

I went to his page & downloaded it.

Have you used it? It's a PC executable file.

So I'm guessing I somehow run it against my fizzled basic program which
exists as an atari floppy image/disk called "basic1.atr"
(well, and on a 5.25 disk in native atari format too!!)

Does that mean I need the actual .BAS file by itself as a file??? (not
contained in an .atr image) hmmmm.....I hate stuff you actually have to
use your brain to figure out. Dag-nabbit, I have to use my brain all day at
work. It usually shuts down by 5:30pm.

zoinks,

Yes, chkbas.exe is a PC executable and it is command line,
you have to have the actual BAS file in the directory you
are working in. I don't remember the syntax, but you may
be able to chkbas /? or /h to get the syntax. Yes, you also
have to have the .BAS file in the directory. Then it might
be something like chkbas yourgame.bas. or chkbas yourgame.bas yourgame.txt.
Shoot. Uhmm.. You might also
want imageman or xdir to remove a copy of yourgame.bas
to the pc directory. imageman and xdir are also PC utilities.

(clicks on pc program icon and gets 'open with?' (notepad).
Uh oh. We gotta get you to a command line. MSDOS icon,
it is in your start list. Then you should create a working directory.
Put imageman or xdir in work, along with your atr.
extract the .bas file from the .atr
also have chkbas in c:\work
chkbas myprog.bas
now your program is in listed form, ATASCII maybe, if ASCII then
you gotta get a program to make ATASCII from ASCII.
now put the LISTed program on the .atr with imageman.
finally, use an emulator, load your favorite DOS. go to BASIC
ENTER the listed program and finally SAVE it back (with a different name,
don't lose your original.)
DOS, DOS, DOS command line hahahahahah!!!

russ,

I was responding to the post from chris martin & his .pl file.
I'm fine with chkbas (that is, after I extract my atari basic file out of a
.atr image)

The plain, old, video line is for your composite signal. If the
one, unused jack is for "chroma", and the other is for "luma", then in
essence you have the makings of S-Video. If the Atari puts out such
signals through its video port, you could then fashion/buy a
RCA-to-S-Video adapter in order to connect to a television/monitor that
has a S-Video jack. Alternatively, you can get a monitor that has
separated chroma and luma connections.

Most likely, *NO*

LLppwhite previously posted:

>> *A stock 800XL has no chroma output unless modified. (That means no
S-video,
unless B/W.)

*Unless you have an 800XL made in Taiwan (maybe 10%), you will still have
relatively poor video, unless modified. Don't blame the Cheesebox, blame
Atari. <<

265. graphics chips and memory modules

Newsgroup: comp.sys.atari.8bit
Date: 2004-01-14 17:04:04 UTC
From: carmel_andrews@hotmail.com
Message-ID: <6912483e.0401140904.4365f811@posting.google.com>
Source record: 17572

I seem to remember years ago someone telling me that T.I (Texas Instruments) invented the first Graphics/Sprite chip in 1976/7

I also seem to remeber someone telling me that HP Pioneered plug in memory modules in the very early 80/s

Personally, from what I know about Atari, and the wealth of technology Atari pioneered, I don't think the above 2 statements are true

According to various websites relating to the VCS/2600, This system had already been finished/prototyped as far back as the Back End of 75 (or to use the americanism 'the fall') but because 'Bushnell's" Atari was so under capitalised (cash strapped) it didn't have the funds to mass produce it (which is why bushnell offloaded Atari to Warners) So that the VCS would have the funds to go into mass production

As I understand it, the Hardware the VCS used, was designed by a subcontractor working for Atari (As I understand it this company was eventually bought out by Atari) one of the Hardware Chips the VCS used was the T I A (I guess somehow related to the C/GTIA of the A8 series), and according to techical doc's released by the designer of TIA (A certain Joe Decuir) The TIA was both a graphics chip and also a sprite chip (or could that be a grphics chip capable of manipulating and displaying sprites)

If this is so, and the fact that the VCS was alreay finished at the back end of 75, surely Atari's effort predates TI's claim by a year or so (or didn't Atari patent it in time)

In addition the concept of plug in memory modules, and HP's claim to pioneering this technology, of HP's claim to hold water, their technology would have had to have predated Plug in Ram based mem. modules (back end of 1978) or 1975/6 for Plug in Rom based mem. modules, because Atari/Fairchild were the first companies to develop Plug in Rom based mem. modules (the VCS/Channel f respectively) in 1975/6 and Atari who developed Plug in Ram based mem. modules for their original computer line (the 400/800 respectively- and most commentators at the time were mentioning that is was the first micro(s) to use Plug in Ram based mem. modules))

Again, Did TI/HP create these technologies, or was it Atari

And to muddy the water a bit, I guess you could say that Atari (with the Help of Activision) singlehandedly created the modern Games Publishing Industry (ususaly refered to has 3rd party s/w developers)- if it wasn't for a certain out of court settlement that Atari/Warners did with Activision, in regards to producing and publishing 3rd party

vcs software... interesting eh..

Doh! With the title "pop quiz" and all, I thought there would be a
GOSUB related error somewhere.

I forgot error 12....the only one I couldn't remember! And I should
have.
Well I did drink decaf this morning. damn decaf.

Some of this stuff is just so deeply etched into my brain, I can't
forget.
What's weird is that back in "the day" (lets call it the 1980s) I knew
the sector lengths, off the top of my head, of almost every game I
had...that came to around 300 programs. I never tried to memorize it,
I just knew. Weird.

Line not found....yeah...I hate that one.

I downloaded some xex files and tried it out.
If you add a boot loader, you can boot binary files that are in the
DOS binary load format. I downloaded passiona.xex and converted it
and it worked. It is a sound and graphics demo. If I recall right
the file frantic.xex also converted fine this way.
I converted them to .cas files and then used cas2wav to convert them
to .wav files, and then wrote them to a cassette tape. They loaded
just fine. That is what the xex2cas program was designed for;
creating a real tape for a real Atari.
Of course the .cas file should also work on the emulator, so I tried
that too. The passiona.cas file worked as a boot tape.
Booting takes 10 to 20 seconds of course, tapes are slow.
The file frantic.cas did not work on the emulator this way.
I get a message that the Atari computer has crashed.
I have not tried to put .bas files on tape this way, but that should
also work, if you do not add the boot loader. (/b option.)
But why use cassette with the emulator? It would be simpler to put
the binary file in some .atr image with a boot menu or some gamedos.
The only reasons I can think of is that you want to test the cassette
before actually writing it to tape (time consuming) or you simple like
cassettes, which means you must be just as crazy as me.

Keep those XL's/XE's buzzing.
Ernest.

Source record: 17578

Ah, yes, that would be useful.

I have updated the script and can be found here again:
http://home.comcast.net/~atariguy1/atari/detokenize.pl

Sorry for the poor explaination before, but this PERL script is for use
with Linux/UNIX or with winperl. I have added a few command line options.
Just type 'detokenize.pl -h' at the unix prompt in order to see the help:

USAGE:
detokenize.pl [-a(tascii)] [-d(ebug)] [-f(ile) <BAS FILENAME>]
-a : Print output in ATASCII
-d : Print some debug information

Example:
detokenize.pl -debug -atascii -file MYPRG.BAS

Now, all debug information goes to STDERR, so you can pipe the output to
a file in ASCII/ANSI or ATASCII.

Cheers,
Chris

yeah, I did read that. But I ignored it and am just moving on.
I'm reminded of those screws at the bottom of any household appliance, with the sticker urging, "do not remove".
You just say to yourself, "well, they can't mean me! I know what i'm doing! Where's my screwdriver?".....and you just plow ahead and do it anyway.

[getting back]
I do have 2 800xl's! Maybe 1 is from Taiwan. Come on, everything else you buy in the U.S. is from somewhere else.

Tell you what.....once I get the cable I need, I'll post and let y'all know if it worked or if it didn't.

Yes, yes, I know it's not the cheesebox's fault....what with its cheesy goodness & everything.

-g'day folks,
& larry

Yeah, good ol' Bender... Not only has he a 6502 in his head, but he's made in
Mexico, as per another episode... I wonder if both facts are somehow related.

Does anyone know if there is a commercially available adapter to connect
dual RCA (chroma and luma) signals into a standard SVIDEO connector? If so,
can you provide a link or contact?

LOL, I thought that was pretty cool. If you get the Season 1 DVD set and listen to the audio commentary for the episode "Fry and the Slurm Factory", David X. Cohen mentioned that the 6502 microprocessor was used in both Apple and Atari computers. Glad to see that the Futurama staff has it's share of computer geeks.

The second season episode, titled "The Honkening", also features some old computer gags... Namely references to TRS-80 and Commodore 64.

Several episodes of Futurama make references to Macintosh and a few to Windows... I've probably learned more about Macs from Futurama than I have through "normal" means. :)

<the.z.guy@comcast.net> writes
>You'll catch some old computer references in the Simpsons, too.
>If I think of one I'll post it.

Gil sells the school some Coleco (IIRC) computers, then tries to sell
rustproofing. In the same scene, Ralph calls Chalmers "Supernintendo
Chalmers".

Homer uses an iMac in various episodes.

Unrelated: IIRC Peggy Hill (King of the Hill) uses a Kaypro ;)

> BTW does a CDi have provision for hardware scrolling of it's video planes?

Yep, it does this through it's display list, which is called 'Line Control
Table' (LCT). Each line can have a command that tells the graphics processor
where to get the video data for this line (line-starts). So hardware
scrolling is done by repeatedly reprogramming the LCT line-starts. I've made
some really smooth text-scrolling routines with this.

> Yet in another game which involves scrolling, Micro-Machines.
> The scrolling background is going jerk, jerk, jerk, while the car movement
> is fairly smooth.

I think the Micro Machines programmers could have done a better job :).
Smooth scrolling of backdrops is one of the things that should cost very
little processing power, so it must be badly programmed.

Hi there Jerry,

If you still have the "Atari Connection" magazines, I am interested in buying them.

I will of course pay the magazines and shipping in advance. Shipping is in this case from your home in the US, to me in Sweden, in Europe.

Please let me know if you are willing to sell the two "Atari Connection" magazines to me, and if you are, for how much.

Best regards,
Anders Skelander

I like the futurama with the part ' WHAT IF MACHINE.... '

Here is a part when one person ask himself 'WHAT IF LIVE WAS LIKE A VIDEO-GAME... '

Then you will see lot's of cool things like:

- Centipede
- Pac-man
- Donkey Kong
- Space invaders
- Mario

And much more it's the most funny part I can remember..

I think this error code means something like "end of file", in the sense
"unexpected end of file".

Anders

Hi gang,

I'm cleaning out some of my collection - here is what I have for sale:

Title Volume Publish Date
Antic Volume 4, Number 5 Sep-85
Antic Volume 4, Number 12 Apr-86
Antic Volume 5, Number 3 Jul-86
Antic Volume 5, Number 4 Aug-86
Antic Volume 4, Number 3 Jul-85

Title Publish Date
Atari Connection Fall 1983

Title Issue # Publish Date
Analog Computing 44 Jul-86

Title Issue # Volume Publish Date
Compute! Issue 46 Volume 6 Number 3 Mar-84
Compute! Issue 47 Volume 6 Number 4 Apr-84
Compute! Issue 49 Volume 6 Number 6 Jun-84
Compute! Issue 50 Volume 6 Number 7 Jul-84
Compute! Issue 52 Volume 6 Number 9 Sep-84
Compute! Issue 53 Volume 6 Number 10 Oct-84
Compute! Issue 54 Volume 6 Number 11 Nov-84
Compute! Issue 55 Volume 6 Number 12 Dec-84
Compute! Issue 56 Volume 7 Number 1 Jan-85
Compute! Issue 57 Volume 7 Number 2 Feb-85
Compute! Issue 58 Volume 7 Number 3 Mar-85
Compute! Issue 59 Volume 7 Number 4 Apr-85
Compute! Issue 61 Volume 7 Number 6 Jun-85
Compute! Issue 62 Volume 7 Number 7 Jul-85
Compute! Issue 64 Volume 7 Number 9 Sep-85
Compute! Issue 63 Volume 7, Number 8 Aug-85
Compute! Issue 65 Volume 7 Number 10 Oct-85
Compute! Issue 66 Volume 7 Number 11 Nov-85

Compute! Issue 67 Volume 7 Number 12 Dec-85
Compute! Issue 68 Volume 8 Number 1 Jan-86
Compute! Issue 69 Volume 8 Number 2 Feb-86
Compute! Issue 70 Volume 8 Number 3 Mar-86
Compute! Issue 71 Volume 8 Number 4 Apr-86
Compute! Issue 72 Volume 8 Number 5 May-86
Compute! Issue 91 Volume 9 Number 12 Dec-87

The magazines range in good (some marking and cover damage) to excellent.

I'd like to sell these all in one shot, so I would say the best offer over the next couple of days would get 'em. If someone were to offer $40 plus shipping it would be a done deal and would make my wife happy. :)

Please email with any questions you might have - thanks!

Hi there,

Theres a few programs I've found that use extra ram. One was "shrink xe" which used 128k, I dunno if many remember it but it was a disk or file compression program that was a favourite of the the toronto pirate bbs scene in the 80's. there was also Shrink xl, the same thing for the 64k computers. Also Basic XE which ICD released (OSS created it if I remember right). Another one I remember I found in the early 90's was Megablast was a european shareware thing I think. I still have that one lying around somewhere too.

Poking into 77 on an atari as I remember either resets the attract mode (screensaver) time or sets it on, or is it the one that puts the text on the screen upside down?

7.7) Are there Graphical User Interfaces (GUIs) for the Atari?
7.8) What should I know about modem device handlers?

Software
8.1) What programming languages are available for the Atari?
8.2) What cartridges were released for the Right Slot of the 800?
8.3) What games support 4 or more simultaneous players?
8.4) What programs run only on the 400 and 800 models, and why?
8.5) What programs make use of the Light Gun or a light pen?
8.6) What programs have a track ball mode or support a mouse?

8.7) What programs have a paddle(s) or Koala Pad mode?
8.8) What programs have a CX85 Numerical Keypad mode?
8.9) What programs have a Touch tablet mode?
8.10) What kinds of RAMdisks can be set up on the Atari?
8.11) What programs support a RAMdisk?
8.12) What programs require a RAMdisk?
8.13) What voice/sound synthesis software is there for the Atari?
8.14) What programs support stereo and upgraded sound?
8.15) What games support online action via modem?
8.16) What programs support Atari computer networking?

Working with Atari files: Compression, File formats, Copying
9.1) How can I work with .arc files on my 8-bit Atari?
9.2) What file formats for entire disks/tapes/cartridges are there?
9.3) How can I copy my copy-protected Atari software?

Interoperating with "modern" computers
10.1) What programs can log in to other computers via modem?
10.2) What programs can I use to host a BBS on the Atari?
10.3) How can I read/write Atari disks on an MS-DOS PC?
10.4) How can I read/write MS-DOS PC disks on my Atari?
10.5) How do I transfer files using a null modem cable?
10.6) How can my Atari use my PC's HD using SIO2PC or Atari810?
10.7) How can my Atari use my PC's HD, printer and modem using APE?
10.8) How can I connect my 1050 drive to my PC with the APE ProSystem?
10.9) What about interoperating with the Apple Macintosh?
10.10) Are there 8-bit Atari tools for the Commodore Amiga?

Timeline
11.1) How did Atari get its name?
11.2) What is the History of Atari?

Subject: 1.1) What is an Atari 8-bit computer?

Based in Silicon Valley in the U.S.A., the company known as Atari produced a line of home computers from 1979 to 1992 often referred to collectively as the "Atari 8-bits," the "8-bit Ataris," the "400/800/XL/XE series," etc.

The computers included the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System.

These machines competed in the marketplace most directly with the likes of the Commodore 64 series, the Apple II series, the Texas Instruments TI99/4A, and the Radio Shack Color Computer, among others. Of these, the 8-bit Atari is most similar to the Commodore 64.

In marketing their computers to the public, Atari always had to contend with their company history and reputation as a maker of video games. While the 8-bit Atari computers in their heyday were technically quite comparable if not superior in the worlds of home and business personal computing, they also live up to the name "Atari" with a huge library of video games which were often

outstanding for their time.

The 8-bit Atari computers do not use the same cartridges or floppy disks as any other Atari platforms, such as the 2600 Video Computer System (VCS), the 5200 SuperSystem, the 7800 ProSystem, or the ST/TT/Falcon computers. All of these but the 5200, however, do share the same joystick/controller hardware port.

The 5200 SuperSystem is actually nearly identical to the 8-bit computers internally, yet cartridges for the 5200 and the 8-bit computers cannot be exchanged, primarly due to the physically different cartridge ports.

Here are some of the performance specifications of the 8-bit Atari computers:

(Some of the rest of this section by Bill Kendrick)

CPU: 6502 (MOS Technology)

CPU CLOCK SPEED:
NTSC machines: 1.7897725 MHz
non-NTSC machines: 1.773447 MHz

SCREEN REFRESH RATE:
59.94 times per second (Hz) on NTSC Ataris
49.86 Hz on PAL machines

GRAPHICS MODES:

ANTIC Mode #	CIO/BASIC Graphics #	Type	Display Resolution (full screen)	Number of Colors
2	0	Char	40 x 24	1 *
3	-	Char	40 x 19	1 *
4	12	++ Char	40 x 24	5

* 1 Hue; 2 Luminances
** 1 Hue; 16 Luminances
*** 16 Hues; 1 Luminance
+ require the GTIA chip. 1979-1981 400/800's shipped with CTIA
++ Not available via the BASIC GRAPHICS command in 400/800's.

GRAPHICS INDIRECTION (COLOR REGISTERS AND CHARACTER SETS):
Nine color registers are available. Each color register holds any of 16
luminances x 16 hues = 256 colors. (Four registers are for player-missile
graphics.

Character sets of 128 8x8 characters, each with a normal and an inverse video
incarnation, are totally redefinable.

PLAYER-MISSILE GRAPHICS: (byte height and OR corrections from Piotr Fusik)
Four 8-bit wide, 120 or 240 byte high single color players, and four
2-bit wide, 120 or 240 byte high single color missiles are available.
A mode to combine the 4 missiles into a 5th 8-bit wide player is also
available, as is a mode to OR colors or blacken out colors when players
overlap (good for making three colors out of two players!) Players
and missiles have adjustable priority and collision detection.

DISPLAY LIST INTERRUPTS (DLI's):
Screen modes can be mixed (by lines) down the screen using the Display
List - a program which is executed by the ANTIC graphics chip every
screen refresh:

All other screen attributes (color, player/missile horizontal position,
screen width, player/missile/playfield priority, etc.) can be ajusted
at any point down the screen via DLI's.

SCROLLING:
Fine scrolling (both vertical and horizontal) can be enabled on any
line on the screen.

SOUND:
Four voices of 8-bit pitch-resolution, 4-bit volume-resolution,
8-distortion sound can be produced. 2 voices (1 and 2, and/or 3 and 4)
can be combined to make 16-bit pitch-resolution. Also 4-bit volume-only
modes can be enabled for digitally sampled sound replay.

A fifth "voice" is produced by the internal speaker on Atari 400/800's
(for keyclick and buzzer) and in the XL's and XE's this was
(fortunately!) rerouted through the normal audio output, and the
keyclick can be disabled.

Subject: 1.2) What is the Atari 400?

Released along with the 800 in 1979, the 400 was the low-end model of the two.
The only 8-bit Atari with a membrane keyboard rather than a full-stroke
keyboard. One of the few 8-bit Ataris lacking a composite monitor port.
Originally released with just 8K RAM, but most were sold with 16K RAM. Atari
sold the Atari 400 48K RAM Expansion Kit, which required a little soldering,
to dealers only.

Only the 400 and 800 8-bit Atari models have four controller (joystick) ports.

Early 400 units include the CTIA chip; later units include the GTIA chip,
also present in all later 8-bit Ataris.

The 1982 Atari catalog calls the 400 "The Basic Computer".

The 400 was discontinued in 1983.

During development the 400 was known internally as "Candy."

Subject: 1.3) What is the Atari 800?

Released along with the 400 in 1979, the 800 was the high-end model of the two. The 800 is the only 8-bit Atari with a Right Cartridge slot, in addition to the Left Cartridge slot as present on all 8-bit Ataris. Originally released with just 8K RAM, many were sold with 16K, later on 48K was standard.

The 800 is also the only 8-bit Atari with a four-slot modular design, where the first slot holds the CX801 (CX801-P for PAL machines) 10K ROM module, and the other three slots hold combinations of CX852 8K or CX853 16K RAM modules.

Only the 400 and 800 8-bit Atari models have four controller (joystick) ports.

Early 800 units include the CTIA chip; later units include the GTIA chip, also present in all later 8-bit Ataris.

The 800 was discontinued in 1983.

During development the 800 was known internally as "Colleen."

Subject: 1.4) What is the Atari 1200XL?

Released as a big brother to the 400/800 in 1982, the 1200XL now uses Atari's slightly customized 6502C microprocessor, and includes a full 64K RAM. The 1200XL was the first 8-bit Atari with just 2 controller ports. In addition, the 1200XL includes 4 programmable Function keys and a Help key, 4 LEDs, built-in diagnostic and graphics demonstration programs, and probably the favorite keyboard of any 8-bit Atari computer. Clicks previously outputted through the built-in speaker are now heard from the television or monitor's speaker. The revised 16K Operating System offers many new features, including an alternate International Character Set.

The 1200XL was the biggest single step forward in development of the 8-bit Atari platform, but the corresponding software compatability problems hurt its popularity.

The 1200XL lacks separate chroma video signal, and also lacks the +5 Volts power on pin 10 of the SIO port.

There is no PAL (European) version of the 1200XL.

The 1200XL was discontinued in 1983.

Subject: 1.5) What is the Atari 600XL?

Released in 1983 as a replacement for the 400, the 600XL is the low-end version of the 800XL. The 600XL/800XL include most of the features of the 1200XL minus the Function keys and the demo program. But both the 800XL and 600XL have the Atari BASIC language built-in. In addition, these two systems offer the Parallel Bus Interface (PBI), providing fast parallel access to the heart of the computer. The 600XL has 16K RAM.

The 600XL can be expanded from 16K to 64K with the Atari 1064 Memory Module.

Rarely, some late-model 600XLs were sold with 64K RAM. These may have only appeared in Canada. The box had a round gold foil sticker reading:
"64k Memory -- Now with a full 64k of memory built-in."

Normally boots with Atari BASIC (Revision B) enabled;
Hold down [Option] on startup to boot without BASIC.

The North American/NTSC 600XL does not include a composite monitor port;
The European/PAL 600XL includes the monitor port, but this lacks the chroma video signal.

The 600XL was discontinued in 1985.

Subject: 1.6) What is the Atari 800XL?

Released in 1983 as a replacement for the 800 and 1200XL, the 800XL is the high-end version of the 600XL. The 600XL/800XL include most of the features of the 1200XL minus the Function keys and the demo program. But both the 800XL and 600XL have the Atari BASIC language built-in. In addition, these two systems offer the Parallel Bus Interface (PBI), providing fast parallel access to the heart of the computer. The 800XL contains 64K RAM.

Normally boots with Atari BASIC (Rev. B, or late models with Rev. C) enabled;
Hold down [Option] on startup to boot without BASIC.

The 800XL lacks separate chroma video signal (exeception next paragraph).

There was a late version of the 800XL in Europe, called 800XLF. The 800XLF includes a redesigned motherboard (the XE design) and contains FREDDIE for memory management and has chroma output. BASIC is Revision C.

Though Atari never disclosed sales figures, the 800XL was likely the most-sold of all 8-bit Atari computer models.

The 800XL was discontinued in 1985.

Subject: 1.7) What is the Atari 65XE?

Released in 1985 as a replacement for the 600XL, the 65XE is the low-end version of the 130XE. The 65XE is nearly identical to the 800XL in features, minus the PBI. Many European (PAL) 65XE's include the ECI port, but no North American (NTSC) 65XE's include the ECI port. All XE computers also include the FREDDIE memory management chip.

Normally boots with Atari BASIC (Revision C) enabled;
Hold down [Option] on startup to boot without BASIC.

The 65XE was discontinued in 1992.

Subject: 1.8) What is the Atari 130XE?

Released in 1985 as a replacement for the 800XL, the 130XE is the high-end version of the 65XE. The 130XE offers 128K RAM, plus the FREDDIE memory management chip, supporting the unique (but rarely used) ability for the 6502 and the ANTIC to independently access RAM banks. In addition, the 130XE replaces the PBI port with the Enhanced Cartridge Interface (ECI), continuing the powerful feature of a fast parallel port.

Normally boots with Atari BASIC (Revision C) enabled;
Hold down [Option] on startup to boot without BASIC.

The 130XE was discontinued in 1992.

Subject: 1.9) What is the Atari 800XE?

Unseen and unknown in North America, the 800XE was sold in eastern Europe. The 800XE is identical in features to the European version of the 65XE, including the ECI port. The 800XE could also be described as a 64K version of the 130XE.

Normally boots with Atari BASIC (Revision C) enabled;
Hold down [Option] on startup to boot without BASIC.

Jindrich Kubec writes, "The problematic Chinese 800XEs with GTIA problems were manufactured in 1992."

The 800XE was discontinued in 1992.

Subject: 1.10) What is the Atari XE Game System?

In a change of marketing strategy, Atari introduced the new XE Game System in 1987. Despite its label, the XEGS is a true 8-bit Atari computer system. It offers the convenience of a detachable keyboard and built-in Missile Command game, while offering 64K RAM and full compatibility with the 65XE. It was packaged with the Light Gun, and the Flight Simulator II and Bug Hunt cartridges.

Keyboard connected/no cartridge:
boots to Atari BASIC
Keyboard connected/no cartridge/[Select] held down at startup:
boots to Missile Command
No keyboard connected/no cartridge:
boots to Missile Command
No keyboard connected/no cartridge/[Select] held down at startup:

boots from disk drive
No keyboard connected/no cartridge/[Select]+[Start] held down at startup:
boots from tape drive

[Option] held down at startup = BASIC on
[Option] not pressed at startup = BASIC off
(opposite from all other XL/XE machines)

Andreas Magenheimer writes:
Tip: The confused XEGS Atarian should use the XEGS manager by Mat*Rat
(Mathew Ratcliff). This assumes one knows at least how to boot a disk
with the XEGS...

James Bradford offers:
There is only 1 32K ROM in the XEGS, it has the OS, BASIC (Rev C) and
Missile Command on it.

The XE Game System was discontinued in 1992.

Subject: 1.11) What are the 6502, ANTIC, CTIA/GTIA, POKEY, and FREDDIE chips?

Some of the following text is taken from De Re Atari (Atari#APX-90008), a book
published by Atari through the Atari Program Exchange (APX) and copyright 1982
by Chris Crawford, et al. See http://www.atariarchives.org/dere/ where the
full text of De Re Atari is now available online.

The internal layout of the Atari 8-bit computer is very different from other
systems. It of course has a microprocessor (a 6502), RAM, ROM, and a PIA.
However, it also has three special-purpose (LSI) chips known as ANTIC, GTIA,
and POKEY. These chips were designed by Atari engineers primarily to take
much of the burden of housekeeping off of the 6502, thereby freeing the 6502
to concentrate on computations. While they were at it, they designed a great
deal of power into these chips. Each of these chips is almost as big (in terms
of silicon area) as a 6502, so the three of them together provide a tremendous
amount of power. Mastering the Atari 8-bit computers is primarily a matter of
mastering these three chips.

6502 Central Processing Unit (CPU)
====
While the 400/800 models contain a generic 6502B CPU (a faster version of the
original 6502A microprocessor), all of the XL/XE models contain Atari's
customized 6502C chip.

On the Atari, there are two microprocessors, ANTIC and the 6502. To allow
them to coexist, ANTIC must shut off the 6502, a process called DMA. The
6502B supports DMA, but in Atari's implementation, it required 4 chips. The
6502C has an extra line called HALT. It is controlled by ANTIC which uses it
whenever it needs the data/address bus. The HALT line is on pin 35 of the
Atari 6502C and must be pulled high for the chip to work.

ANTIC
=====

ANTIC ("Alpha-Numeric Television Interface Circuit") is a microprocessor dedicated to the television display. It is a true microprocessor; it has an instruction set, a program (called the display list), and data. The display list and the display data are written into RAM by the 6502. ANTIC retrieves this information from RAM using direct memory access (DMA). It processes the higher level instructions in the display list and translates these instructions into a real-time stream of simple instructions to GTIA.

Frank Schuster writes (6/1/02):
the patent for the ANTIC processor:

U.S. Patent 4,296,476 October 20, 1981 for a "Data processing system with programmable graphics generator". Inventors listed: Steven T. Mayer; Jay G. Miner; Douglas G. Neubauer; Joseph C. Decuir

CTIA/GTIA
=========
CTIA ("Color Television Interface Adapter") / GTIA ("George's Television Interface Adapter") is a television interface chip. ANTIC directly controls most of GTIA's operations, but the 6502 can be programmed to intercede and control some or all of GTIA's functions. GTIA converts the digital commands from ANTIC (or the 6502) into the signal that goes to the television. GTIA also adds some factors of its own, such as color values, player-missile graphics, and collision detection.

Early 400/800 models included CTIA, later 400/800 models and all later 8-bit Ataris included GTIA.

In BASIC, type POKE 623,64 [RETURN] and if the screen blackens, you have the GTIA chip. If it stays blue, you have the old CTIA chip.

By the way, apparently no CTIA-equipped Ataris were shipped to Europe.

Clay Halliwell provides this tidbit:
A bit of trivia: CTIA 400/800s artifact in blue/green, GTIA 400/800s artifact in green/blue, and all XL/XEs artifact in red/blue.

Jerry Jessop explains why French Ataris produce fewer colors:
I will tell you why it only has monochrome out, because it's SECAM and a SECAM GTIA was never produced. The PAL GTIA is used in France and the Lum outputs are run into an onboard encoder to produce a "psudo" color depending on the Luminance output, composite only. This is why a SECAM VCS or 800 has nowhere near the same number of colors (16) availible as a PAL or NTSC unit (256).

The FGTIA was never completed as the market size did not warrant the expense. The largest SECAM market is not France but the Soviet Union (former) and in 80-84 sales of these items there were not possible.

Frank Schuster writes (6/1/02):
..here a summary of Atari patents covering technical parts of the GTIA / CTIA or at least the steps of development to it. I found them by following the references made in the "newest" patent 4,324,401 which at the end

stands for the GTIA.

U.S. Patent 4,324,401 April 13, 1982 for a "Method and system for generating moving objects on a video display screen". Inventors listed: David R. Stubben, Lyle V. Rains. References: 4,116,444; 4,107,665

U.S. Patent 4,189,728 February 19, 1980 for an "Apparatus for generating a plurality of moving objects on a video display screen utilizing associative memory". Inventor listed: David R. Stubben. References: 4,116,444; 4,045,789

U.S. Patent 4,116,444 September 26, 1978 for a "Method for generating a plurality of moving objects on a video display screen". Inventors listed: Steven T. Mayer; Ronald E. Milner. References: 4,016,362; 3,793,483

U.S. Patent 4,107,665 August 15, 1978 for an "Apparatus for continuous variation of object size on a raster type video screen". Inventors listed: Steven T. Mayer; Ronald E. Milner

U.S. Patent 4,045,789 August 30, 1977 for a "Animated video image display system and method". Inventor listed: Stephen D. Bristow. References: 3,793,483

U.S. Patent 4,016,362 April 5, 1977 for a "Multiple image positioning control system and method". Inventors listed: Stephen D. Bristow; Steven T. Mayer. References: 3,793,483

U.S. Patent 3,793,483 February 19, 1974 for a "Video Image Control System for Amusement Device". Inventor listed: Nolan K. Bushnell

POKEY
=====
POKEY (means "POT and KEY" as in the paddles and keyboard) is a digital input/output (I/O) chip. It handles such disparate tasks as the serial I/O bus, audio generation, keyboard scan, and random number generation. It also digitizes the resistive paddle inputs and controls maskable interrupt (IRQ) requests from peripherals.

All four of these LSI chips function simultaneously. Careful separation of their functions in the design phase has minimized conflicts between the chips. The only hardware level conflict between any two chips in the system occurs when ANTIC needs to use the address and data buses to fetch its display information. To do this, it halts the 6502 and takes control of the buses."

The USPTO granted U.S. Patent 4,314,236 to Atari on February 2, 1982 for an "Apparatus for producing a plurality of audio sound effects" - POKEY. Inventors listed: Steven T. Mayer, Ronald E. Milner

FREDDIE
=======
The 65XE/130XE/800XE/XEGS contain a small additional LSI called FREDDIE, a RAM address multiplexer. According to James Bradford, "FREDDIE is a type of memory controller. It takes the address and clock from the CPU and multiplexes it with the appropriate timings and signals to use DYNAMIC memory.

FREDDIE also buffers the system clock crystal and divides it down then feeds that to GTIA. The XEGS has a FREDDIE but it doesn't have the extended RAM. Even if it did, you would still need the chip that does the REAL bank switching. It is a small 16-pin chip (Atari/Best Electronics catalog number CO25953: rev9/page 42). It gets RAS from FREDDIE, the bank select bits from PIA, A14, A15 and the 6502 halt signal to control which bank of 8 chips RAS goes to. A14 and A15 then go to FREDDIE for the address range of the extra memory bank (or normal address range with no bank switching). The ANTIC/6502 select bits in combination with the 6502 halt line, control the switching of the PIA bank number bits to A14/A15 and which bank of memory RAS goes to. Why people say FREDDIE does the bank switching is beyond me. An 800XL can look like a 130XE with that 16-pin chip installed (That's right NO FREDDIE) and an extra 8 RAM chips."

And more recently James Bradford has written:
FREDDIE is just a memory decoder and timer. It replaces several chips in the 800XL. The small chip near FREDDIE does all the bank selection. CO25953. One line from FREDDIE, Ras (or is it cas?) goes to this chip, Halt and the bank /processor select lines go into this same chip and ras (cas?) comes out. A pin for each bank. If I remember correctly, refresh also goes into this small chip. It would be quite easy to make an 800XL work just like a 130XE with this chip since Ras (Cas?) is required by ALL dynamic RAM.

======
Technical data sheets and schematics for the ANTIC, GTIA, and POKEY chips are available on Curt Vendel's web site, thanks to permission from Hasbro's Atari Interactive Division's release of this data. See the TIFF scans:
http://www.atari-history.com/articles.html
Keith Howell has converted the hi-res TIFFs into clean HTML:

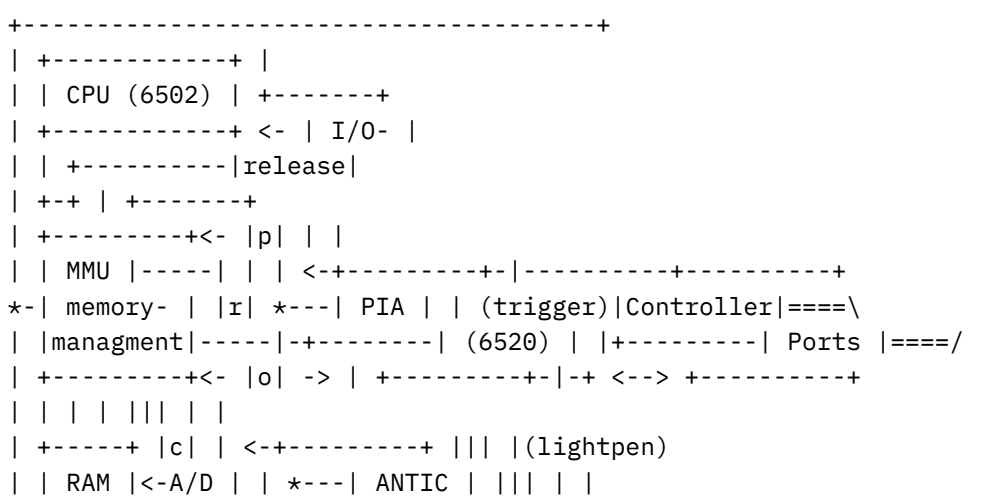
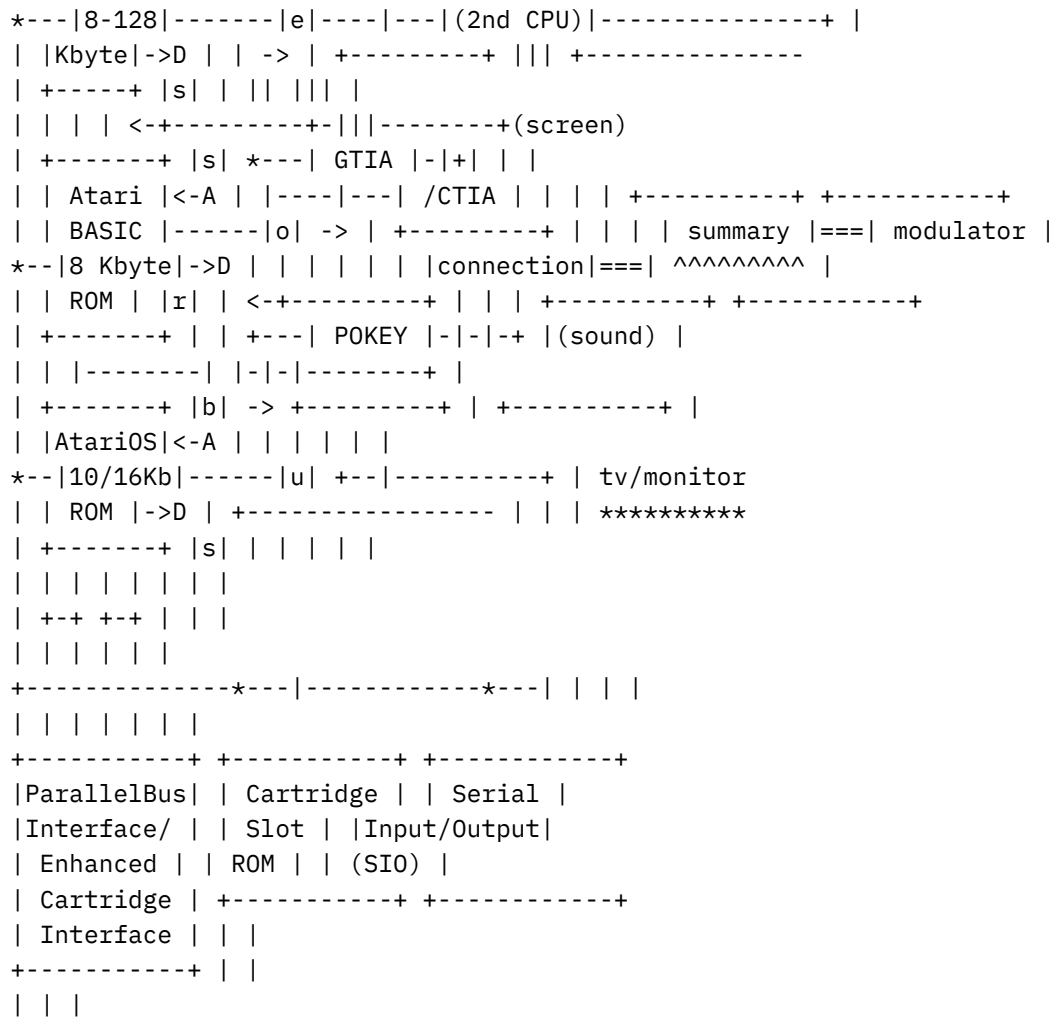
Subject: 1.12) What is the internal layout of the 8-bit Atari?

ASCII art by Thomas Havemeister.





- memory expansion -cartridge with - disk drive
- Z80 card programs - printer
- 80 char card (games , dos) - modem

NOTES
* RAM: 400/800: 8K, 16K or 48K standard
600XL:16K standard
1200XL/800XL/65XE/800XE/XEGS: 64K standard
130XE:128K standard
* ROM: 400/800:10K OS, 1200XL:16K OS, all others:16K OS + 8K Atari BASIC
* CPU: 400/800:6502B, all others:6502C
* 800 includes two Cartridge Slots, all others include one
* early release 400/800 have CTIA instead of GTIA
* 400/800 have 4 Controller Ports, all others have 2
* PBI is on 600XL/800XL only
* ECI is on 130XE/800XE/many PAL 65XE only
* Some late XE's use a 68B21 for PIA; PIA is 6520/6520A on all others

The following are most of the team who originally designed the 400/800.
Credit for providing this information for the FAQ goes to:
Doug Neubauer (by way of James Finnegan), Jerry Jessop, Scott Emmons

Subject: 1.13) What issues surround NTSC vs PAL versions of the 8-bit Atari?

Contributors to this section:
Wayne Booth, Graham Thornton, Brent Buescher Jr., Thomas Richter, Jindroush

Some quick definitions first:

NTSC standard: Abbreviation for "National Television Standards Committee"
TV signal standard used in North America, Central America, a number of South American countries, and some Asian countries, including Japan.
525 lines per frame
60 half-frames per second (interlaced) = 60 Hz
Complete frame refreshed 30 times per second

PAL: Acronym for "phase alternation by line"
TV signal standard used in the United Kingdom, much of the rest of western Europe, several South American countries, some Middle East and Asian countries, several African countries, Australia, New Zealand, and other Pacific island countries.
625 lines per frame
50 half-frames per second (interlaced) = 50 Hz
Complete frame refreshed 25 times per second.

PAL-M: A modified version of PAL, used in Brazil.

SECAM: Acronym for "systeme electronique couleur avec memoire"
TV signal standard used in France, eastern European countries, the former USSR, and some African countries.
625 lines per frame
50 half-frames per second (interlaced) = 50 Hz
Complete frame refreshed 25 times per second.

Now then, how do the differences among 8-bit Atari computers designed for the different world television signal standards affect users trying to use software written elsewhere in the world?

The 50Hz vertical refresh frequency of PAL machines translates into more vertical blank interrupt (VBI) time for demos and other computation-intensive graphics software, when compared to the time available for VBIs on NTSC

machines with the faster 60Hz refresh frequency. So PAL demos and games that won't work on NTSC machines are usually returning from a VBI too late. Some also attempt to use more vertical resolution ("longer" display lists) than an NTSC display can handle.

Note that the reverse is also true. Software using VBIs will run more slowly on a PAL Atari than on an NTSC Atari.

Replacing the NTSC ANTIC chip in an NTSC Atari with a PAL ANTIC changes the screen refresh rate to 50Hz, allowing most of the PAL-only European software to run on a North American NTSC Atari. However, make sure your display device can support a 50Hz PAL signal first! North American Atari users can also obtain and use real European PAL Atari machines, with the same caveat concerning the display device.

Bottom line:
Software written for NTSC machines (North America) will (almost) always work on PAL machines (Europe), but software designed on PAL machines won't necessarily work on NTSC machines.

Jindroush contributes: (2/26/02)
Could there be a program which runs on NTSC Atari and not on PAL Atari?
Yes, if it uses some precise timing copy protection (probably based on vblank timing). Examples of these are Transylvania and The Quest by Penguin Software.

Thomas Richter mentions another NTSC vs PAL issue:
Another point is that the popular pseudo-colors used in the ANTIC-F (Graphics 8) mode are not colorful at all when displayed on a PAL TV, because of differences in the color encoding for the TV. The schematics of the XL computers include however a hack how to change the PAL version to the NTSC version (the PAL versions include two crystals, one with 5/4th of the frequency of the other. One is used for the system clock, the other for the color clock), but I never dared to apply it.

And on 10/16/03 Thomas Richter answered a related question this way:
>> Note that it's typically not too hard to get an NTSC Atari to run in PAL
>> by just swapping out the ANTIC chip.
>>
>> Unfortunately, some demos actually check the OS ROM for a particular
>> value to see if it's a PAL machine or not, and then refuse to run if
>> they are. *grumble* I'd rather have a warning than a refusal. :^P

> As far as I am aware, the only value to tell a PAL from a NTSC machine is in
> GTIA. Maybe swap that one as well and see what you get

Absolutey correct, GTIA keeps the PAL/NTSC register and the Os rom reads it from there. However, besides the GTIA PAL and NTSC machines differ in other aspects. For example, on PAL machines an additional oscillator of 5/4 of the main frequency is present to generate the color frequencies needed to drive GTIA. There is no such circuit in NTSC Ataris. Besides, this factor of 5/4 is also the reason why you don't get "artifacted colors" on PAL machines (or, at least, not very good ones.)

Subject: 1.14) What are the pinouts for the various ports on the Atari?

Controller Port (4 on 400/800, 2 on all others):

Subject: 2.1) What video display devices can I use with my Atari?

Contributors to channel output variations list:
Jon Levy, Rene de Bie, Sysop Fox-1

Most 8-bit Atari computers put out video signals in two places:

1) Radio-Frequency (RF) signal, either one VHF channel, or two VHF channels selectable by a switch on the computer. Variations depend primarily on the part of the world that the particular version of the computer was desgined for.

Most North American computers: VHF channels 2-3 switch-selectable.
channels 3-4 switch selectable also reported
European computers: VHF channels 3-4 switch-selectable,
or no switch (what channel?) both reported
UK computers: VHF channel 36, no switch,
or channels 38-39 switch selectable both reported
Australian computers: VHF channel 1 (400/800: channels 1-2 selectable)

Any further clarifications would be appreciated!

Accessories needed:
a) RF Cable. (RF=radio frequency--video and audio signals in the same line)
On the 400/800 models, the RF Cable does not detach from the computer.
The output end of the cable is an RCA male connector.

b) TV Switch Box. Includes an RCA female connector for RF signal input from
the Atari, input connector(s) for your TV attenna and/or cable TV
company, and 75- and/or 300-ohm VHF output connector(s) for connection to
the VHF input on the television. (Radio Shack carries a suitable TV
Switch Box.)

2) A proprietary 5-pin DIN Monitor Jack, which includes two video signals:
a) Composite video.
b) Y/C Video, also known as S-Video:
separate composite luminance (Y) and chrominance (C) signals.

Exceptions among the computer models:
-the 400 and North American 600XL lack the Monitor Jack.
-the XE Game System includes an RCA-style jack in place of the Monitor Jack,
providing a plain composite video signal only.
-the Monitor Jack on the 600XL, 800XL(most) and 1200XL lacks the separate
chrominance signal. (But it exists internally, and can be restored to the
monitor jack via hardware modification.)

The pinout for the Atari Monitor Jack is in the pinouts sections of this FAQ
list.

The typical Atari Monitor Cable includes the male 5-pin DIN connector on one
end, and two RCA male connectors on the other end. One of the RCA connectors
will carry the monophonic sound signal, and the other will carry the composite
video signal. Color composite monitors were common in the mid-80's, but these
days many televisions have an RCA female composite video input connector which
works fine with the Atari.

You may find an Atari Monitor Cable where the video signal carried on the
second RCA connector is not the composite video signal, but the composite
luminance signal. These cables are for use with monochrome composite video
monitors (usually green or amber).

The ideal Atari Monitor Cable includes 3 RCA male connectors on the output
end, carrying the sound signal, the composite luminance signal, and the
composite chrominance signal. Only the best composite monitors include
separate chrominance and luminance inputs. Commodore produced many fine
monitors of this type, popular with Atari users.

Lonnie McClure provides this information on suitable Commodore monitors:
1701, 1702, 1802, CM-141, 1080, 2002, 1902, 1902A*, 1084**, 1084S**

* The 1902A used a DIN connector for chroma/luma, which makes cabling a bit more of a problem. The composite and audio connectors are standard RCA jacks, however.

** The 1084 and 1084S had more than one version. Some used the a DIN connector for chroma/luma connections, like the 1902A, while some used standard RCA jacks.

The 1902 and 1902A are very different in appearance. The original 1902 shares the same slightly rounded front case design as the 1080 and 2002, while the 1902A is has a rather square case design, and was manufactured by Magnavox (as were some of the 1084 and 1084S versions).

The separate composite chrominance and luminance signals that the Atari puts out comprise what the world has since come to call Y/C video or S-video. S-video connectors are normally Mini4. It is possible to build a cable, or purchase several adapters, that can allow you to utilize the separate Y/C signals generated by the Atari with a television (or other display device) that provides a standard S-video Mini4 input jack. This is the ultimate display option for the 8-bit Atari. Clarence Dyson has a nice page about such a project at http://www.wolfpup.net/atari/svideo.html .

Adapters also exist that will take in composite video or s-video, and output a conversion of the signal as a standard VGA video signal. These are often known as a "VGA converter" or "Scan doubler." With such a device, the 8-bit Atari can be used with a standard PC VGA monitor. One such adapter is the Cheese Video Box, http://www.avtoolbox.com/vd-660.htm . An earlier popular device was the JAM!! from AIMS Lab.

SCART - an acronym for Syndicat des Constructeurs d'Appareils Radiorecepteurs et Televiseurs - is a 21-pin universal connecting cable/socket system used for audio/video components in Europe. The cables transmit RGB, composite video, S-Video, mono and stereo sound. SCART, which is also known as PERITEL, EURO AV BUS and EUROCONECTOR, is common throughout Europe, particularly in France, England, Germany, Switzerland, and Scandinavia. SCART is also very popular in the Russian Audio Video market. It is possible to interface the Atari's composite video signal, along with the audio signal, through a SCART connector, though there have been few reports of people actually doing this.

Keith Howell has a nice page on some of these topics:
http://www.howell1964.freeserve.co.uk/Atari/800XL/Atari_800XL_Video.htm

December 2003--More Than Games announced "A8 A/V BOB", an audio/video breakout box featuring phono connectors for composite video, chroma, luminance, and mono audio; it also features an s-video jack providing chroma and luminance. http://www.a8maestro.com/sites/mtgcat/mtgcat.htm

---

Subject: 3.1) What are the Atari 410, 1010, XC11, and XC12 Program Recorders?

The Atari Program Recorders provide storage and retrieval of programs
and data on cassette tape. In addition to the digital track that stores
computer data, a second audio track is provided to play music or voice
as the program runs.

Data transmission rate: 600 bits per second.
Data storate capacity: 100,000 bytes per 60-minute cassette.
Track configuration: 4 track, 2 channel (digital data and audio track)

410 Program Recorder
- early Japan version had a carrying handle
- most versions made in Hong Kong
- 410a--Taiwan version
- built-in SIO cable - must end SIO daisy chain
- power - plugs directly into wall (most versions)
- "410P" version (rare). Karl Heller writes:
"It came in the white 410 box with an Atari yellow/orange paper slip
stating which power supply to use with it."

1010 Program Recorder
- Chelco version has Stop/Eject, then Pause buttons
- Sanyo version has Pause, then Stop/Eject buttons
- two SIO ports

XC11 Program Recorder
- has a built-in SIO cable and one SIO port

XC12 Program Recorder
- built-in SIO cable - must end SIO daisy chain
- Information on the Turbo 6000 Baud Interface and the Chaos Loader:
http://www-user.tu-chemnitz.de/~sgl/atari/turb6000/turb6000.htm

---

Subject: 3.2) What other cassette recorders can I use with my Atari?

Firstly Atari themselves put out several models beyond the 410/1010/XC11/XC12,
generally only known in eastern Europe:

XCA12 Program Recorder -in same case as XC12...Poland
CA12 Program Recorder -in same case as XC12...Poland
image: http://romualdl.multimania.com/images/atari/ca12.jpg
XL12 Program Recorder -XC12 w/slight changed design. Czech/Slovak/Poland
XC13 Program Recorder -XC12 which was "T2000 ready". Czech/Slovak/Poland

For more information on the Turbo 2000 (T2000) and SuperTurbo modifications to
Atari program recorders, with speeds up 9600 baud, see
http://jindroush.atari.org

Unlike other microcomputer systems of the time, it was very unusual to use
anything but Atari brand program cassette recorders. One third-party product
released was the:

Compu-Mate, by General Electric (GE, G.E.)
Includes external interface module, a power cord/adapter, and SIO cable.

No second SIO port - must be at end of SIO chain.

Subject: 3.3) How do I run a program from cassette?

To run an Atari BASIC program from cassette:

1. Place the cassette in the recorder.
2. Press REWIND of FORWARD, if necessary, to bring the tape to the position where the program is located.
3. Boot the computer to the Atari BASIC READY prompt.
4. There are several possibilities for the next step, depending on how the program was saved, and whether you want to run the program or just load it into RAM. Enter one of the following four commands:
a. CLOAD loads programs saved with CSAVE
b. LOAD "C:" loads programs saved with SAVE "C:"
c. ENTER "C:" loads programs saved with LIST "C:"
d. RUN "C:" loads&runs programs saved with SAVE "C:"

] Relative efficiency of the three cassette tape recording techniques:
] CSAVE/CLOAD - most efficient - fastest saves/loads - tokenized files
] SAVE "C:"/LOAD "C:" - middle efficiency - middle speed - tokenized files
] LIST "C:"/ENTER "C:" - least efficient - slowest - straight ATASCII

5. The computer will "beep" as a signal for you to press PLAY on the recorder.
6. Press the RETURN key on the computer keyboard, and the program will load into the computer.
7. Press STOP on the recorder when loading has finished.
8. Unless you entered RUN "C:" above, now enter the command: RUN

To run an Atari BASIC or machine language program from cassette upon startup:

1. Place the cassette in the recorder
2. Press REWIND of FORWARD, if necessary, to bring the tape to the position where the program is located.
3. Turn on the computer while holding down the START key.
But if your computer has Atari BASIC built-in and you're running a machine language program, hold down both the START key and the OPTION key.
4. The computer will "beep" as a signal for you to press PLAY on the recorder.
5. Let go of the START/OPTION button(s).
6. Press the RETURN key on the computer keyboard, and the program will load into the computer.
7. Press STOP on the recorder when loading is complete and the program is running.

Subject: 3.4) What are the Atari 810, 815, 1050, and XF551 Disk Drives?

Section includes contributions by Andreas Magenheimer, TXG.

The Atari Disk Drives provide storage and retrieval of programs and data on 5.25" floppy disks.

==> Atari 810 --- a 5.25" floppy disk drive
The least common denominator for the Atari. One mode of operation:
1) Single-Sided, Single-Density--
FM 40 tracks x 18 sectors/track x 128 byte/sector = 90K capacity
19.2Kbps transfer rate. 288RPM.
The 810 includes a 6507 microprocessor.
Shipped with DOS 1 (very early) or DOS 2.0S
earlier MPI version- push button door opening for disk access
later Tandon version- lift door, like a garage door disk access
two SIO ports
accessories from Atari:
CX8100 Atari 810 Blank Diskettes (5 per box)
CX8111 Atari 810 Formatted Diskettes II (5 per box)
CX8202 Atari 810/815 Blank Diskettes (5 per box, certified for double density)

Third-party upgrades for the 810:
810 Archiver -- copy many copy-protected programs
Happy 810 -- Happy Backup, Warp Speed 52Kbps, 18 sector buffer
810 Fast Chip by Binary 10%-40% faster
810 Turbo by Neanderthal Computer Things (NCT) -- double-density
see: http://www.qnet.com/~dons/810T.html

==> Atari 815 Dual Disk Drive --- dual 5.25" floppy disk drives in one unit
Were produced (all hand-built), but are very rare. One mode of operation.
Per drive:
1) Single-Sided, Double-Density--
MFM 40 tracks x 18 sectors/track x 256 bytes/sector = 180K capacity
19.2Kbps transfer rate. 288RPM.
The 815 includes a 6507 microprocessor.
Shipped with DOS 2.0D
MPI mechanism version- push button door opening for disk access
Tandon mechanism version- lift door, like a garage door disk access
accessories from Atari:
CX8202 Atari 810/815 Blank Diskettes (5 per box, certified for double density)
Stephen Knox writes (12/28/02):
I believe the story on the 815s was Atari didn't want to release them due to
severe QA problems with the drive but they had so many preorders they had to
release something. I think they filled the preorders and then cancelled the
model - Most of them got returned due to problems.

==> Atari 1050 --- a 5.25" floppy disk drive
Same as the 810, plus Dual-Density capability. Two modes of operation:
1) Single-Sided, Single-Density, 90K, 810 compatible
2) Single-Sided, Dual-Density, otherwise known as "Enhanced Density" because
it is not true double-density--
MFM 40 tracks x 26 sectors/track x 128 bytes/sector = 128K capacity
19.2Kbps transfer rate. 288RPM
The 1050 includes a 6507 microprocessor.
Shipped with DOS 2.0S, DOS 3, or DOS 2.5
DIP switches: Black & white left: Drive 1
Black right, white left: Drive 2
Black left, white right: Drive 3

Black & white right: Drive 4
Third-party upgrades for the 1050 (all add a true SSDD 180K capability):
US Doubler (ICD) SS SD/ED/DD UltraSpeed (US) 54Kbps, sector skewing
Happy 1050 SS SD/ED/DD Warp Speed 52Kbps, 36 sector buffer,
Happy Backup. also read/write 180K 5.25" MS-DOS floppies
I.S. Plate (Innovated Software) SS SD/ED/DD Ultra/Warp (USD/Happy clone)
Hyper Drive (Chaos! Computers) SS SD/ED/DD Warp Speed 52Kbps (Happy clone)
Super Archiver (CSS) SS SD/ED/DD UltraSpeed 54Kbps (US Doubler clone)
Super Archiver II(CSS)SS SD/ED/DD UltraSpeed 54Kbps (US Doubler clone)
Cheer-Up 1050 SS SD/ED/DD Warp Speed 52Kbps (Happy clone)
Speedy 1050/Mini-Speedy SS SD/ED/DD Warp Speed 78,000Baud (Happy clone),
8kbytes
(Klaus Peters) Track/Cache buffer, built-in DOS and/or HSS-Copy;
Super Speedy 1050 SS SD/ED/DD Warp Speed 96,000Baud (Happy clone),192K RAM
SuperMax 1050 SS SD/ED/DD UltraSpeed 52Kbps (US Doubler clone)
Lazer 1050 SS SD/ED/DD Warp Speed and UltraSpeed 54Kbps
Engl-Turbo-1050 SS SD/ED/DD Turbo Speed approx. 70,000 Baud (uses
(german Turbo) Sector skewing that differs from USDoubler)

Rich Mier professes:
You've been plugging and unplugging the SIO cable with the 1050 power pack
plugged in, right? That's a no-no. Most of the time it's Okay, but about 1
in 10, 20 times, it will blow out 'U-1'. It's a CA/LM 3086 I.C. at the right,
rear of the main board. A 14 pin DIL chip. Actually it is an array of 5
transistors.

Unplug the power pack from the 1050, then unplug the SIO cable. Power can be
ON on the CPU. The problem has to do with the secondary winding of the Power
Pack. Remember, the problem only occurs 1 out of 10 - 20 times that you do
it, not all the time.

It doesn't really matter if the 1050 Transformer has power on or off, it
'Might' happen if plugged into the 1050. It is really bad on 810's.

One thing, if the system has been turned off for, oh say, 5 - 10 minutes it
won't matter. By then all the capacitors should be bled(sc?) to 0 volts.

==> Atari XF551 --- a 5.25" floppy disk drive. Four modes of operation:
1) Single-Sided, Single-Density, 90K, 810 compatible
2) Single-Sided, Enhanced-Density, 128K, 1050 compatible
3) Single-Sided, Double-Density, 180K, Percom & other 3rd parties compatible
4) Double-Sided, Double-Density--
MFM 80 tracks x 18 sectors/track x 256 bytes/sector = 360K capacity
Writes "backwards" to the second side of the disk, when compared to a two-
sided "flippy" disk with SSDD 180K format on each side
High speed 38400 bps burst mode usable only with SpartaDOS X, SuperDOS 5.1,
TurboDOS, DOS XE, and patched SpartaDOS 3.2.
Rotaton rate: 300RPM. Since all other Atari-specific drives run at 288RPM,
this results in rare compatibility issues. Specifically, these commercial
disks do not load in, and can be damaged by, the XF551:
- Flight Simulator II (subLOGIC)
- Blue Max (Synapse)

- Bank Street Writer (Broderbund). Conflicting reports about this one.
8040 cpu + external ROM or 8050 cpu with internal ROM
Shipped with DOS 2.5 or DOS XE.
DIP switches: Both dips down: Drive 1
Left down, right up: Drive 2
Left up, Right down: Drive 3
Left and Right up: Drive 4
Chinon-built XF551-cannot read/write/format backside if no timing hole
Mitsumi-built XF551--can read/write backside if to timing hole, if formatted
Third-party upgrades for the XF551:
CSS XF Single Drive Upgrade--3.5", 720K floppy drive replacement
also read 720K 3.5" MS-DOS disks
see
http://www.nleaudio.com/css/products/XFsingdrup.htm
CSS XF Dual Drive Upgrade--add 3.5" drive w/o losing the 5.25" drive
also read 720K 3.5" MS-DOS disks
see
http://www.nleaudio.com/css/products/XFdualdrup.htm
CSS XF551 Enhancer--overcomes sensor for index hole, create flippy disks
see
http://www.nleaudio.com/css/products/XF551enh.htm
CSS XF Update--replace drive OS, adds UltraSpeed
see
http://www.nleaudio.com/css/products/XFupdate.htm
Hyper-XF-OS--avaiable for 5.25" or 3.5" floppy versions; uses sector skewing
and UltraSpeed (but no track buffer!); can use disk partitions
(2 on 5.25", 4 partitions on 3.5") with mixed Densities (S/E/D)
or standard 360kbytes (5.25") / 720kbytes (3.5"); can
theoretically read/write ST/PC 720k disks (software is missing!)
OS created by Stefan Dorndorf/Germany;
XF-Speedy--replaces the 8040 CPU with a 65C02 + ROM + Memory

Subject: 3.5) What other floppy disk drives can I use with my Atari?

Major contributors to this section: Glenn M. Saunders, Tomasz M. Tatar,
James Bradford, Konrad M. Kokoszkiewicz, Don Schoengarth, Andreas Magenheimer

SS=Single-Sided SD=Single-Density, 90K/disk side
DS=Double-Sided ED=Enhanced-Density, 128K/disk side
DD=Double-Density, 180K/disk side

Printer port=has a standard DB25 parallel printer port,+ maybe a print buffer
Master=includes drive controller, can add additional,non-Atari-specific drives

Top transfer rate=19.2Kbps unless stated otherwise

Subject: 3.6) What kinds of 5.25" floppy disks can I use with my Atari drives?

Russ Gilbert writes:
If you're talking standard computer store, you can't use those 5 1/4" disks. I
mean you can't use high density disks. They must be double density to use
with the 1050. Almost all double density 5 1/4" disks have a hub ring, high
density disks don't have the hub ring.

RHamiIton5 elaborates: (5/12/01)
The Atari 8 drives do not have write heads and circuity which can handle the
type of oxide coating used on the high density floppy media; they cannot write
reliably to them. The hub ring has just become a sort of marker to distinguish
the high density from the standard double density diskettes.

Way back in your apple days of '79-'82, most disks were hubless and only the really premium brands offered hubs to prevent slippage and out of round problems; you could even buy little kits for adding you own hub rings.

When the home computer swell really hit around '83 and price wars began, hub rings became common on good disks and eventually became standard down to include most generic bargain diskettes.

The introduction of high density 5.25's required a different coercivity (= magnetizability) to get more bits in a smaller space and suitable electronics to do it. These disks were produced hubless; was it a differentiating label or just unnecessary because of stronger mylar construction? Anyone?

Subject: 3.7) How can I use a hard drive with my 8-bit Atari?

Atari never produced hard drives for the 8-bit Atari, but a variety of options have been produced over the years. No common DOS version was written with drives the size of hard drives in mind, and very few 8-bit Atari users have owned hard drives for the Atari. Yet, if you're serious about it, a hard drive can make a tremendous addition to your system!

A couple of these options are hard drives designed specifically for the 8-bit Atari computers; the rest are interfaces designed to let you attach an industry standard SASI, SCSI, or IDE type hard drive. Customized software (OS, DOS) is often involved as well.

Larry White contributed to some of these descriptions.
Additional Corvus info from an eBay auction by Ben Corr, 7/03.

==> Corvus hard drive (5MB, 10MB, or 20MB)
Attaches via joystick ports 3 & 4 on the Atari 800 only.

-- Corvus Integrator Board - alows access to the Corvus Disc without the Corvus software, so that any DOS that uses standard SIO calls will work.

-- Corvus Multiplexer - used to network up to 8 Ataris to one Corvus Drive

- Corvus Mirror card - back up the drive's contents onto video tape

==> SupraDrive Atari Hard Disk, by Supra, later K-Products. 10MB or 20MB.
includes external Hard Disk Interface
Some limitations on drive type and size and total number of drives in sys.
Attaches via PBI, or ECI with adapter.
See: http://www.atarimagazines.com/v5n6/Supradrivefor8Bit.html
Maybe still available from Bob Klaas?

==> BTL Hard Disk System
BTL 2001 Connector for 600XL/800XL PBI
BTL 2002 Connector for 130XE/800XE/65XE ECI
BTL 2004 SASI Hard Disk Adapter
See: http://www.atarimagazines.com/v5n12/BTLHardDisk.html

==> Multi I/O (MIO) interface, by ICD. Includes:
- Parallel printer interface

- Serial interface, for modem or serial printer. will handle 19.2Kbps
- 256K or 1 MB RAM, for RAMdisk or printer spooler
- SASI/SCSI interface, supports up to 8 controllers.
Limited to drives with 256-byte sectors.
Attaches via PBI, or ECI with adapter.

==> CSS Black Box interface
RS-232 Serial Modem Port (19.2Kbps) w/ hardware flow control,
Parallel Printer Port,SASI/SCSI Hard Disk Port, Operating System Enhancements,
optional 64K printer buffer. Supports drives with 512-byte sectors.
PBI/ECI device. Available: http://www.nleaudio.com/css/products/black.htm

==> SmartIDE project by Bob Woolley
Uses 256 of the normal 512 byte sectors. Point-to-point wiring project.
Articles and software at http://www.wolfpup.net/atari/atari.html

==> IDE Hard Drive Interface 1.0
By Konrad M. Kokoszkiewicz (Draco) and Jacek Zuk
PBI device. Logical sector length: 256 or 512 bytes
Availability???

==> Fine Tooned Engineering (FTe) Multi I/O II (MIO II) interface
An IDE interface. Several exist, but it was never really released

==> msc-IDE Controller
created by Steve Birmanns and Matthias Belitz
* real device for the parallel-port (PBI/ECI) of the Atari XL/XE
* up to 240 partitions per harddisk supported
* emulates D1: until D9: of disk devices (access to 9 partitions at one time)
* full bootable from any partition (with standard XL-OS)
* write protectition capability
* supports master/slave configuration
* more than 30 KB/s file access with SPARTA-DOS 3.2 gx (reading)
* more than 10 KB/s file access with SPARTA-DOS 3.2 gx (writing)
* software partially supports CD-ROM and ZIP drives.
Sold out.
http://www.birmanns.de/atari/

==> Gary Morton's BadSector"A" Project
Wants to connect his IDE drive to the SIO bus.
http://www.alma.demon.co.uk/Atari/AtariProjects.html

==> MyIDE interface and software by Mr.Atari, Sijmen Schouten
Point-to-point wiring project. Different units for 800 and XL, including a
cartridge version for the XL.
http://home.wanadoo.nl/mr.atari/

==> SIO2IDE, by Marek Mikolajewski (MMSoft)
The SIO2IDE is a simple interface that allows you to attach any IDE Disk
Drive to your 8-bit Atari computer. Latest interface version has the
following main features:

* ATARI side:
- uses standard Atari SIO at a speed of 19200 baud
- works with Atari High Speed SIO (US and Happy) at a speed of 52000 baud
- emulates Atari disks D1: to D8:
- can be used with any Atari DOS and OS
- can be used without any problems with other SIO devices (disk drivers,
printers, modems, SIO2PC, second SIO2IDE etc)
- can be easy installed inside your Atari with 2.5' laptop HD
- is easy to configure via special fdisk.com utility software
(changing disks sequence and active directory)
* IDE device side:
- all IDE ATA/ATAPI devices can be used: Disk Drives (2.5' and 3.5'),
CD-ROMs, Compact Flash cards etc.
- supports PC file systems, FAT16 and FAT32
- supports CD file system, ISO9660
- supports ATR disk images (SD, DD up to 16MB)
- supports directory change (multiconfig)
- is easy to configure, many text configuration files (sio2ide.cfg) can
be stored in different directories
- disk configuration can be checked by special checkfs.exe PC utility
NOTE: checkfs.exe does NOT work with HDD connected via USB port
- standard disk utilities can be used (defrag.exe, scandisk.exe etc)
* USB port side:
- interface works as Mass Storage Class device (removable drive)
- no drivers are needed for Windows 2K, ME, XP
- driver for Win98 is included in this SIO2IDE package

http://www.atari.cuprum.com.pl/sio2ide.htm

==> Nathan Hartwell's IDE projects
http://www.magelair.com/

Subject: 4.1) What are the Atari 820, 822, and 825 Printers?

The following printers were produced by Atari and styled to match the 400/800
computers.

Atari 820 Printer:
- 40-column impact printer
- 5x7 dot matrix
- 40 characters per line, upper & lower case alpha
- horizontal and vertical alphanumeric characters
- 6507 microprocessor, 6532 RAM I/O chip, 2K ROM
- 40 characters per second
- uses Standard Roll Paper/adding machine paper

Atari 822 Thermal Printer: (= Trendcom Model 100)
- 37 characters per second
- 10 characters per inch
- 40 characters per line, upper/lower case and point graphics
- 5x7 dot matrix

Atari 825 80-Column Printer (= Centronics 737)
- 3 character sets:
monospaced 7x8 dot matrix at 10 characters per inch
monospaced condensed at 16.7 cpi
proportionately spaced Nx9 dot matrix at avg of 14 cpi (N=6..18)
- all characters can be elongated (printer double width)
- characters per line: 80 at 10 cpi; 132 at 16.7 cpi
- speed: 50 cps at 10 cpi; 83 cps at 16.7 cpi; 79 cps avg. proportional
- print buffer: 1200 dot columns
- paper: roll, fanfold, or cut sheets
- requires Atari 850 Interface Module or equivalent

Subject: 4.2) What are the Atari 1020, 1025, 1027, and 1029 Printers?

The following printers were produced by Atari and styled to match the XL series computers.

Atari 1020 Color Printer:
(= Commodore 1520 / Oric MCP40 / Tandy/Radio Shack CGP-115 /...; made by ALPS)
- 4-color graphics: (black, red, blue, green). optional 8-pen rainbow package
- alphanumberics and X,Y plotting capability
- 10 cps (40-column mode)
- 20, 40 and 80-column modes
- horizontal and vertical alphanumerics, English and International chr sets
- water soluble ink pen technology
- 4-pen barrel print head
- microprocessor
- paper: standard roll paper (40 column width)
- AtariGraphics cassette software included

Atari 1025 80-Column Printer: (= Okidata ML80)
- 40 cps (80-column 10 cpi mode)
- 5 cpi expanded (40 col), 10 cpi (80 col), 16.7 cpi condensed (132-col)
- 5x7 character dot matrix
- buffer: 132 chrs at 16.7 cpi, 80 chrs at 10 cpi
- paper: roll,fanfold,single sheets. optional:roll paper holder, tractor feed

Atari 1027 Letter Quality Printer: (= Mannesmann Tally Riteman LQ.)
- fully formed characters, prestige elite 12)
- 12 characters per inch (80 columns)
- 20 characters per second
- single sheets or roll paper

Atari 1029 Programmable Printer (by Seikosha)
- 7-pin dot matrix, same as Commodore MPS-801
- Released for Europe & Canada (not USA)
- Rich_N_Feymus says:
I think its a SEIKOSHA GP500, but not 100% sure. However, the Commodore MPS-801 ribbons should be much easier to find.
- The Tandy DMP 110 is another model reported to be the same as the 1029.

Subject: 4.3) What are the Atari XMM801 and XDM121 Printers?

The following printers were produced by Atari and styled to match the XE
series computers.

Atari XMM801 Printer: (= SHINWA CP80)
- 80 columns, dot matrix
- friction feed or pin feed
- pica 10 cpi, double width pica 5 cpi, elite 12 cpi,double width elite 6 cpi,
condensed 16.5 cpi, double width condensed 8.25 cpi
- Ribbon: Commodore 1526 and the Mannesman-Tally Spirit 80

Atari XDM121 Printer:
- 80 column, daisy wheel--letter quality
- underlining, subscripts, superscripts
- friction feed paper
- Ribbon: Silver Reed CF130, Olivetti ET201,ET221,Nu-Kote NK136

Subject: 4.4) What other printers can I use with my Atari?

Some third-party printers were marketed for use with the Atari 8-bit
computers:

Alphacom 42 + Atari interface cartridge
- requires 850 Interface or equivalent
- thermal
- 4 1/2" width paper
- supports complete ATASCII character set

Axiom AT-100 / Seikosha AT-100 / Seikosha GP-100A Graphic Printer
- built-in Atari interface, cable and connector, 2nd SIO port for daisy-chain
- dot matrix
- early model 30-cps, later version 50 cps
- Graph-AX graphics software package

Axiom GP-550AT (by Seikosha)
- built-in Atari interface, cable and connector, 2nd SIO port
- dot matrix
- 86 cps draft, 43 cps NLQ
- Graph-AX graphics software package

Axiom GP-700AT (by Seikosha)
- built-in Atari interface, cable and connector, 2nd SIO port
- 4 hammer print heads, 4-color ribbon cartridge
- 25 colors
- 50 cps
- Graph-AX graphics software package

Epson HomeWriter 10
- plug-in cartridge interface for the Atari
- 80 column dot-matrix printer

- draft quality printing at 100 cps and near letter quality at 16 cps

General Electric GE 3-8100 / TXP 1000
- GE Printer Interface Module for Atari
- dot-matrix
- 50 cps draft, 25 cps NLQ

Okidata Okimate 10 Personal Color Printer
- available Plug 'n Print Interface for Atari
- a thermal printer.
- single-sheet or tractor-feed paper.
- 26 colors
- 240 words per minutes

Beyond the above printer models, most any "industry-standard" line printer can work well with the Atari. For many years, most printers marketed for home use could be classified into one of two categories: parallel or serial interface. Parallel line printers are much more commonly used than serial line printers, with the Epson MX/FX/LX series defining the market.

The most common way to use an industry standard printer with the Atari has been to attach it through the 15-pin 8-bit parallel port of the Atari 850 Interface Module or equivalent (such as the ICD P:R: Connection). One gotcha here is that the 850's parallel port is DB15, where the PC world ended-up standardizing on a DB25 configuration. So you need to find or build a cable that provides the DB15 connector for the Atari end (and Centronics-type parallel connector on the printer end) when attaching a standard parallel printer to the Atari through an Atari 850 or equivalent.

Many 3rd-party disk drives for the Atari (along with the XEP80 Interface Module) do include a DB25 parallel printer port, rendering the need for an Atari-specific printer cable unnecessary.

The Atari 850 Interface Module and equivalents also provide standard DB9 serial RS232C ports, permitting use of standard serial line printers with the Atari. But this is much less common than parallel, both in the Atari world and in the industry at large.

Some folks have connected more modern inkjet and laser printers with parallel connections to the 8-bit Atari with success. Graphics printouts from the Atari may be less than ideal (look for a printer with an Epson MX/FX/LX printer series emulation mode), but these types of printers should work fine for plain text output if they can handle simple line print jobs. Anyone want to contribute their experiences to be included here?

Bob Woolley wrote on Sun, 14 Apr 2002:
I use HP LaserJet 4Ps on my Ataris. They are one of the last front panel selectable cheap printers - from which you can select your default fonts, etc. The newer laser printers can only set fonts and operating modes thru the interface, not impossible, but not as easy as selecting on the panel. This does allow you to print just about any point size of the internal fonts in the printer on your Atari.

Either way, you really have to do a little work to get properly formatted output from a word processor. I have managed to use the proportional font setting with AtariWriter and printer driver creation utilities to get good results.

Mathy van Nisselroy provides an AtariWriter printer driver for the HP LaserJet here: http://www-users.rwth-aachen.de/mathy.van_nisselroy/stuff.htm

Modern printers designed for home markets now tend to provide USB connectors.

Subject: 5.1) What are the Atari 830, 835, 1030, XM301, and SX212 Modems?

A MODulator/DEModulator translates digital information from your computer into acoustic tones that can be sent and received, from modem to modem, via standard telephone lines.

Atari produced several modems for use with the 8-bit Atari computers:

Atari 830 Acoustic Modem: (= Novation 'CAT')
- a stand-alone, acoustically coupled, frequency shift keying (FSK) modem
- up to 300 bits per second
- Bell 103/113 modem compatible
- requires Atari 850 Interface Module or equivalent

Atari 835 Direct Connect Modem:
- 300 bps
- Bell 103/113 modem compatible

Atari 1030 Direct Connect Modem:
- 300 bps
- Bell 103/113 modem compatible
- built-in ModemLink software.
- 2 SIO ports

Atari XM301 Modem:
- 300 bps
- Bell 103/113 modem compatible
- with XE Term disk software
- permanent SIO cable, must be at end of SIO chain
- draws its power from the computer via SIO

Atari SX212 Modem:
- SIO & DB25 RS232 serial ports, must be at end of SIO chain
- 1200 baud
- Bell 103/113/212A modem compatible
- rarely with SX-Express! disk software.

Subject: 5.2) What other modems can I use with my Atari?

Some third-party modems were marketed for use with the Atari 8-bit computers:

==> Microconnection, by Microperipheral Corp.
300 bps, Bell 103 compatible, T-SMART software, pulse dialing (not touch tone)
Four versions:
buss-decoding version does not require 850 Interface or equivalent, includes
DB25 parallel printer interface, with or without autodial
Plain version requires 850 Interface or equivalent, with or without autodial
and autoanswer

==> MPP-1000C, by Microbits Peripheral Products
300 baud, joystick port 2, Smart Terminal cartridge

==> MPP-1000E, by Microbits Peripheral Products
300 baud, joystick port 2, Smart Term software
From: "Steven J Tucker" Sun, 13 Jan 2002 16:14:38 -0500
The 1000E..had this strange problem in that it could never hang up the phone

==> MPP-1200A, by Microbits Peripheral Products
Released? Vaporware?
1200 bps, joystick port 2

==> 300 AT, by Supra (same as MPP-1000E)
300 baud, joystick port 2, Smart Term software

==> 1200 AT, by Supra
1200 baud, Hayes compatible, connects to SIO via SupraVerter/R-Verter cable,
Smart Terminal software

==> Volksmodem, by Anchor Automation
300 baud, 'F' Cable permits connection to joystick port 2

==> Q-MODEM, by Quantum Microsystems
300 baud, two SIO connectors, QuanTerm disk or cartridge

Beyond the above modem models, most any "industry-standard" external serial
modem can work well with the Atari. These have been commonly sold for PCs for
many years. The Hayes Smartmodem more or less defined the market for these,
initially.

One common way to use an industry standard external serial modem with the
Atari is to connect it to the SIO port via an Advanced Interface Devices
(A.I.D., later Supra) R-Verter Serial Bus Modem Adapter cable, or equivalent.

The other common way to use an industry standard external serial modem with
the Atari is to attach it through the 9-pin RS232C serial port of the Atari
850 Interface Module or equivalent (such as the ICD P:R: Connection). One
gotcha here is that the serial port on the 850 is DB9 female, where the PC
world ended up standardizing on a DB9 male connector for this purpose. But
gender converters are readily available.

For using modems at speeds of 2400 bps and up with the Atari, it will be
useful to have an understanding of data flow control. Here is a definition
of flow control from www.modems.com:

Often, one modem in a connection is capable of sending data much faster than
the other can receive. Flow control allows the receiving modem to tell the

other to pause while it catches up. Flow control exists as either software, or XON/XOFF, flow control, or hardware (RTS/CTS) flow control. With software flow control, when a modem needs to tell the other to pause, it sends a certain character, usually Control-S. When it is ready to resume, it sends a different character, such as Control-Q. Software flow control's only advantage is that it can use a serial cable with only three wires. Since software flow control regulates transmissions by sending certain characters, line noise could generate the character commanding a pause, thus hanging the transfer until the proper character (such as Control-Q) is sent. Also, binary files must never be sent using software flow control, as binary files can contain the control characters. Hardware, or RTS/CTS, flow control uses wires in the modem cable or, in the case of internal modems, hardware in the modem. This is faster and much more reliable than software flow control.

Some 2400 bps modems, and probably all modems with 9600 bps speed capabilities and up, normally use V.42 standard error correction and V.42bis standard data compression. But V.42 requires either software or hardware flow control, and V.42bis requires hardware flow control (and V.42 error correction).

Hardware flow control is not available with the Atari 850's serial ports.

As a result, just before dialing out with your Atari telecom software, it's usually desirable, if not necessary, to disable your modem's flow control.

The Hayes modem command to disable flow control looks like:
AT&K0

The top speed of the Atari 850's serial ports is 9600 bps.

Clay Halliwell offers a tip on utilizing 9600 bps through the 850 Interface:
On 11 Feb 1996, Marc G. Frank said:

> I'm having problems getting a modem attached to my Atari 850 to
> communicate at 9600 baud. When I set my communications program to 2400
> baud, everything works fine. However, when I set it to 9600 baud, the
> modem echoes my characters but doesn't act on them. That is, at 2400,

The problem with the 850 is that some of them (like mine) don't produce a PERFECT 9600 baud signal. As a result modems can't train on it, and while they will echo characters back, for some nitpicky reason they won't pick up on the "AT" attention code.

The solution is to do all your dialing at 2400 baud, but set the S37 register to force the modem to try to connect at 9600. Then switch your Atari to 9600 after connecting.

Through the use of an ICD MIO or a CSS Black Box, it is possible to utilize modems at speeds up to 14.4 Kbps (V.32bis) at full speed with no loss of data. The serial R: device handler for the Black Box supports hardware flow control natively. Optional for the Black Box, but essential for the MIO, is the HyperSpeed handler by Len Spencer.

Hyperspd.arc is available at http://members.aol.com/lenspencer/atari8.htm

---

Subject: 6.1) What is the Atari 850 Interface Module?

While the Atari's SIO and controller ports did not conform to established industry standards, Atari produced the 850 Interface Module to address this issue. The 850 connects to the SIO port on the Atari, and provides:

- four 9-pin serial EIA RS232C ports
- One 15-pin 8-bit parallel Centronics-type port

Many "industry standard" (of the time) printers, modems, and various other devices can be used with the Atari computer in combination with an 850 Interface Module.

Early 850's are in an all metal (black) case, but most are in a plastic beige case matching the 400/800 computers. Other features:
- programmable baud rate on any port, including:
75, 110, 134.5, 150, 300, 600, 1200, 1800, 2400, 4800, and 9600 bps;
baudot speeds of 60, 66, 75, 100 words per minute
- uses standard ASCII. Baudot support for radio-teletype (RTTY).

PINOUTS

850 R1: Serial port DB9P:

15. D7 + 9
No connection to shield + Frame - to the shield wire

Because the 850 was relatively expensive, provided more capabilities than the average user was looking for, and was at times unavailable from Atari despite high demand, there were many 3rd-party interfaces designed to provide some compatible subset of the 850's features. Perhaps the most prominent example of such a product is the P:R: Connection from ICD.

Subject: 6.2) What is the Atari XEP80 Interface Module?

This text written by Thomas Raukamp.

Since the development of the Atari 8-bit line of computers in 1979, users wanted better text displays than the default 40x24. There has been some attempts to satisfy this need, like the Austin-Franklin board or the Ace 80/80xl cartridge. For more informations about these modifications read The Atari 8-bit Hardware Upgrade FAQ from David A. Paterson.

The Atari XEP80 Interface Module is Atari's entry to the 80 column field. It lets a XL, XE, 400 or 800 computer system display a full 80 columns across your monitor screen. The XEP80 provides a 256-character wide by 25-line display window. Up to 80 characters are displayed horizontally at once, and you can scroll horizontally all the way to the 256th character, depending on

the application you're running. The XEP80 is connected to your system via a joystick port.

The XEP80 Module interprets commands from the computer for screen display or output to a printer. The module is supplied with an industry-standard 8-bit parallel port so you can connect a parallel printer to your Atari 8-bit (I even use a HP LaserJet IV on my 130XE ;)).

All programs that use the standard screen call (E:) should be compatible with the XEP80 Module. The software provided by Atari supports a 320x200 graphics mode - this mode only support direct bit images. Note that you can't use all of the standard graphic capabilities of the Atari anymore.

Although Atari recommends a monochrome monitor for usage with the XEP80, it runs fine with any type of composite monitor. The output looks great on my Commodore 1084 for example.

Along with the module comes a software-package containing an AUTORUN.SYS file, which is the XEP80 handler. If you want to use the module with an application that is compatible with the XEP80, which has it's own AUTORUN.SYS file, you can append the application's AUTORUN.SYS on the module's AUTORUN.SYS.

Subject: 6.3) What accessories did Atari produce for their 8-bit computers?

This should be a complete list of Atari "CX" accessories, two or three digit numbers, marketed for use with the 8-bit computers.

CX30-04 Paddle Controller Pair
CX40-04 Joystick Controller Pair
CX40 Single Joystick Controller
CX41 Joystick Repair Kit
CX22 Trak-Ball Controller
CX23 Kid's Controller
CX24 Pro-Line Joystick
CX42 Remote Control Wireless Joysticks

CX50 Keyboard Controller Pair
CX70 Light Pen (beige; the original Atari light pen)
CX75 Light Pen (+ Atarigraphics cartridge)
CX77 Touch Tablet (+ AtariArtist cartridge)
CX78 Joypad (shipped with the 7800 in Europe)
CX80 Trak-Ball
CX81 I/O Data Cord (5 ft)
CX82 Monitor Cable (Black and White Monitor)
CX85 Numerical Keypad (+ software Handler on diskette)
CX86 Printer Cable (included with 825 Printer)
CX87 Interface/Modem Cable (included with 830 Acoustic Modem)
CX88 Interface/Terminal Cable (null modem)
CX89 Monitor Cable (Color Monitor)
CX418 The Home Manager Kit (Personal Financial Management, Home Filing Manager
-or- Family Finances, The Home Filing Manager)
CX419 The Bookkeeper Kit/Atari Accountant (The Bookkeeper disk, CX85 keypad)
CX481 The Entertainer (Star Raiders, (Missile Command or Pac-Man), 2
joysticks)
CX482 The Educator (410, BASIC cart., States & Capitals cassette)
CX483 The Programmer (BASIC, BASIC Ref. Manual, BASIC Self-Teaching Guide)
CX484 The Communicator (850, 830, TeleLink I cart.)
CX488 The Communicator II (835, TeleLink II cart.)
????? The Arcade Champ (Pac-Man, Qix, 2 joysticks, cartridge storage case)
????? The BASIC Tutor I (Inside Atari BASIC book,Invitation to Programming
2&3)
CX852 8K RAM Memory Module (for 800 computer)
CX853 16K RAM Memory Module (for 800 computer)
XG-1 Light Gun (+ Bug Hunt cart.)

Subject: 6.4) What "vaporware" computers/peripherals were never released?

Atari was a HUGE company, dominating Silicon Valley, and included a massive
research and development department which famously designed many, many
products that never saw the light of day. Here is a brief listing of many
Atari hardware model designations known to have existed internally to the
company, but which were never sold and are extremely rare (if they ever
existed at all). For definitive information on unreleased Atari products,
see:

Atari Historical Society, http://www.atari-history.com/ (Curt Vendel)

Atari 8-bit vaporware computers: (note some are more vaporous than others)
800D (Developers Bus System)
1000 Sweet 16 Project, lower end model. Became the 1200XL
1000-X Sweet 16 Project, higher end model. Became the 1200XL
1200 1200XL internally, many slight cosmetic differences
1200XLS 1200XL Show prototype, top-mounted cartridge slot
600 early 600XL, all black case, joyports on the left, missing PBI
800XL brown prototype
800XLD low-cost 1450XLD,no modem&speech,include disk drive

controller&FREDDIE
800XLCR Cost Reduced, with CGIA chip ("Keri"), which is a combined GTIA&ANTIC
900XLF early name for 65XE
1250XLD Earlier name for the 1450XLD
1400XL brown prototype
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XL 1400XL plus room for 2 internal 5.25" drives (controller not
included)
1450XLD 1400XL plus 5.25" floppy drive (Epson SD521 360K disk drives)
1600XL Amiga/Amiga-like.Now appears that 1850XLD was the model name for this
1650XLD to use 1450XLD case and 1200XL keyboard
1850XLD "Mickey" Atari clone of the Amiga Lorraine
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMY sound chip

Atari 8-bit vaporware peripherals: (note some are more vaporous than others)
1027 PLUS -daisy-wheel, 80 columns
1053 -looks like a 1050, but supports DS/DD 360K format
1055 -a 1050 (SS/ED) with a 3.5" mechanism
1060 CP/M Add-On Module -"SweetPea" Z-80 CPU, 64K RAM, CP/M 2.2, 80 col
display
1090 XL Expansion System-5 PBI slots, CP/M/MS-DOS/Apple II compatible
XM128 -12" green monitor w/ built-in 80-column card
XC1411 -composite 14" color monitor (Goldstar)
XF521 -5.25" floppy drive - 1050 compatible, in XE style
XF351 -a 3.5" drive.
XC35 -an XF551 with a 3.5" mechanism
XTM201 -non-impact printer
XTC201 -XE Thermal Color Printer

Subject: 6.5) What are the power requirements for my Atari components?

Thanks to Matthias Belitz for the European
data in this section. I need more international help!

As with the rest of this FAQ list, please let me know if any of this
information conflicts with the units you have.

The most important information is the voltage (in volts) required, and
whether you need a transformer (AC output) or an adapter (DC output).
The power (in voltamps or watts) and current (in amperes) specifications
of the original equipment as presented here should be regarded as
minimum values. Higher-than-specified power and current capacities are
entirely usable, and often preferable because such supplies run cooler
and last longer.

Direct Current (DC):
Power (in watts) = current (in amps) * voltage (in volts)

Alternating Current (AC):
Apparent Power (in voltamps) = current (in amps) * voltage (in volts)

Effective/True Power (in watts) = current (in amps) * voltage (in volts)
* (cosine of the angle of lag)

N O R T H A M E R I C A INPUT = 115-120 V AC, 50/60Hz

These draw their power from the SIO +5 V:
XM301 (60 mA),XC11,XC12,ICD P:R: Connection,Wizztronics MidiMax,R-Verter

Draws power from the 600XL PBI:
1064

These have built-in power supplies (plug directly into the wall):
410 (except "410P"),815,820,825,1025,1029,XMM801,XDM121

OTHER:
The ICD Multi I/O (MIO), all versions, can use both AC and DC supplies, BUT:

stick to voltages of at least 6.2-7.2 V.
On 2003.09.01 James Bradford wrote: "Doesn't matter what polarity the centre is, the MIO has a fullwave bridge rectifer in it.
AC would be better because the diodes would be used half the time."
Indus GT: see Atari#CO18187 or CA019141 above
Rana 1000: 9 VAC 3.4 AMPS
MPP1000C modem: 9 V DC 200 mA (1.8 W)

Subject: 6.6) What graphic tablets were produced for the Atari?

This section by Andreas Magenheimer.

- Atari Touch Tablet by Atari (came with Atari Artist cart., Micro Illustrator compatible),
- Koala Pad by Koala Industries (came with Koala/Micro Illustrator cart.);
- Powerpad by Chalkboard Inc. (came without software!); the following carts were available separately for the Powerpad: Micro Illustrator, Leo's Lectric, Micro Maestro, The Programmers Kit, Logic Games, Bear Jam (as refered to Antic, September 1984);
- Animation Station by Suncom (came with Micro-Illustrator cart.);

Subject: 6.7) What lightpens were produced for the Atari?

This section by Andreas Magenheimer.

- Atari Lightpen (came with Atari Graphics cart.; it produces pictures with 127 sectors in length, thus not Micro-Painter, nor Micro-Illustrator compatible; however appropriate converter programs can be found in the public domain, e.g. the Rapid Graphics Converter);
- Edumate Lightpen (came with a disk with 6 Basic programs; a program called Peripheral Vision was available separately from Future House);
- Tech-Sketch-Lightpen (came in two versions: a) the cheaper version which included a disk with Basic programs only and b) the more expensive version which included the disk with Basic programs and the Micro-Illustrator cartridge);
- MC-Pen-Lightpen (came with a disk with 4 Basic programs);
- Reston Lightpen (came with ???);

Note: these infos were taken from Antic, September 1984; I am not sure, if all these items were really available as listed...

Subject: 6.8) What lightguns were produced for the Atari?

This section by Andreas Magenheimer.

- Atari LG-1 Lightgun (came in two versions: a) complete with XEGS, keyboard, joystick, power supply, tv-cable, Lightgun, FS II cart and

Bug Hunt cart all in one package and b) in a separate package,
containing the Lightgun and the Bug Hunt cartridge); thats's why Bug
Hunt does not have its own package, it was always included with the
Lightgun package and/or the complete XEGS package...
- BEST Lightgun by Best Electronics (a sort of selfmade (?) Lightgun);
- Sega-Lightgun (normally not Atari compatible; but can be converted
into an Atari compatible lightgun easily);
- other lightguns (most of these have to be converted)...

Note: After having 3-4 Atari and at least one (converted) Sega lightgun,
it is my personal impression, that the Atari lightgun merely works ok
on/with TV-sets (and not at all with a monitor), whereas the Sega lightgun
works alright on TV's and (most) monitors. Since I never had a Best
lightgun I cannot comment on this one... (Andreas Magenheimer);

Subject: 6.9) What paddles were produced for the Atari?

This section by Andreas Magenheimer.

- Atari Paddles (usually a pair of Paddles);
- Telegames Paddles (available as a) a single paddle and b) a pair
of paddles);
- Reston Paddles (available as a) a single paddle and b) a pair
of paddles);
- and many others...

Note: Both single and duo (pair) paddles are compatible to each other,
using only one port-connector (only one joystick port). Thus, with a pair
of paddles you can connect up to 4 paddles (2 pairs) to the XL/XE models
and up to 8 paddles (4 pairs) to the Atari 400/800 models.

Subject: 6.10) What voice/sound synthesis hardware was produced for the Atari?

This section by Andreas Magenheimer.

- Voice-Box II by The Alien Group (a software and hardware package);
- 1400XL/1450XLD Voice Synthesizer (built-in chip inside the extreme rare
Atari 1400XL/1450XLD models);
- Talk is Cheap by Ed Stewart, Antic Volume 2 Number 4, July 1983,
pages 64-66; hardware schematics only (a test/demo program is
mentioned in the text, but not printed in the magazine!);
- Cheap-Talk by Lee Brilliant, Analog Computing, issue 29, April 1985,
pages 59-67; hardware schematics and software demos, for example
"First Words");
- many other voice synthesizers (mostly selfmade and based on a chip by
National Semi Conductor);

Subject: 6.11) What sound-digitizers/samplers were produced for the Atari?

This section by Andreas Magenheimer.

- Parrot (2-Bit) by Alpha Systems, Anthony Ramos;
- Parrot-2 (2-Bit or 4-Bit?) by Alpha Systems, Anthony Ramos;
- 2-Bit Replay (2-Bit) by 2Bit-Systems Ltd.
- Sound N'Sampler (2-Bit) by Ralf David;
- Sound Digitiser (2-Bit) by Ralf David;
- Sound-Meister (2-Bit) by Irata;
- Sound-Digitizer (2-Bit) by Irata;
- Digitales Mikrofon (2-Bit) by Compyshop;
- Voice-Master (2-Bit) by Covox Inc.;
- Analog-Sample-Processor (2-Bit) by Steven Lashower (Analog Magazine);
- Atari-Sound-Sampler (2-Bit) by Andreas Binner and Harald Schoenfeld (german Atari magazin 1/1989, pages 44-49, complete with schematics, documentation, sample-program and assembler-source);
- Alphasys-Sound-Sampler cart. (4-Bit) by ANG/Mirage (released as a mono version; a stereo (two Pokeys!) version was promised/planned, but afaik never released);
- ARGS-XE-Sampler (8-Bit) by ABBUC regional group ARGS (only one or two prototypes exist, alas the hardware was never released due to lack of (sampling/digitizing) software; maybe a good idea for the hardware and software experts out there!);
- and many others ...

Subject: 6.12) What sound-enhancement upgrades were produced for the Atari?

This section by Andreas Magenheimer.

a) enhancements for stereo-sound:

- POPS, polyphonic-pokey-sound by Lee Brilliant (stereo-support with one Pokey!); refer to Analog Computing, issue 66, november 1988, pages 54-60; only 1-2 programs exist for this mod., see: 8.14 stereo-software for the Atari;

- stereo with two Ataris (and thus 2 Pokey chips); use computer/pokey 1 for the left channel and computer/pokey 2 for the right; no special hardware required for this trick (but specially programmed software!); see also: 8.14 stereo-software for the Atari;

- stereo with 2 Pokey chips (in one Atari!); refer to an article written by Chuck Steinman (which probably appeared in Atari classic?) on how to upgrade your Atari internally with a second Pokey chip; or ask Freddy Offenga for a deluxe-stereo-version, that uses a PCB instead of the piggy-back method. For a list of software that supports this mod. see also: 8.14 stereo-software for the Atari;

- Stereo-Blaster and Stereo-Phaser by Portronic/AMC-Verlag, these were hardware add-ons that connected via the monitor jack to the Atari and gave you "another" monitor jack and 2 cinch connectors to connect to the monitor and/or the hifi-system; various small paddles (4-10, depending on the model you have) make it possible to change amplitudes,

frequencies, etc. and thus generate a "pseudo-stereo" sound. These add-ons also amplified the sound and thus made quality recordings of Atari sounds much easier. Alas, these hardware add-ons were quite expensive and thus not many (less than 100) were sold. Therefore no special software is required, every A8 sound can be changed or enhanced to "simulated-stereo"...

- Stereo-Blaster-Pro, a hardware add-on by Portronic/AMC-Verlag similar to Stereo-Blaster and Stereo-Phaser, but programmable! This add-on had only 1 small paddle, to amplify the sound-volume; the stereo-sound could be generated via two simple Poke-Statements, a demo-disk therefore was included. Alas, not many items were sold and afaik no-one else programmed stereo-software for it. See also: 8.14 stereo-software for the Atari...

b) other sound enhancements:

- Covox-Sound-Enhancement, originally developed in Poland; with some electronic parts and pieces you can upgrade your Pokey's abilities, to playback any digitised/sampled sound with 8-Bit resolution, instead of its usual 4-Bit digi/sample playback resolution (see also 8.14).

- SID-upgrade, the SID is the standard sound-chip in the C64 computers. Some polish freaks/nerds have found a way to include it into an A8, but allthough I have seen quite a lot of pictures (for example at atariarea.nostalgia.pl) with this mod. and already found 1 or 2 programs that detect it (for example System Info 2.x by Draco), I have not yet found any schematics for this upgrade. Anyway, it exists, and with some programming skills it would surely be possible to write programs then, that playback SID sounds on those Ataris which have this upgrade installed...

- Amie/Amy sound-chip, the Amie sound-chip was originally produced by Atari and installed into the 65XEM computer. Alas, it was never available to the public and only very few prototypes of this 65XEM (maybe less than 10?) do exist. Besides of that RUMOURS say, that Atari had quite some problems with this soundchip and never finished it completely/successfully. If the rumours are true, then this soundchip provided many more sound channels, more octaves and even more and better sound power than two Pokeys together (for more infos take a look at this URL:)

- guess there are dozens of other sound enhancements, for example sound cards (like Adlib, etc.), sound-chips, midi-interfaces, etc. that could be attached or converted to the A8; I won't name them all here...(A.M.)

Subject: 6.13) What MIDI enhancements are there for the Atari?

This section by Andreas Magenheimer and Mathy van Nisselroy.

Midi is standard on the Atari ST computers, because it is built-in into these computers. Nevertheless, Midi was long before the arrival of the ST computers on the market and thus, it is no surprise that there are even midi-interfaces and enhancements for the classic 8Bit Ataris. The following "types" do exist:

- "Midi-Mate" and "Midi-Track" by Hybrid Arts (USA), comes with hardware + software, see reviews & tests in Antic, Analog and other magazines. MidiTrack requires 48k RAM, MidiTrack II 64k RAM and MidiTrack III 128k RAM (XE compatible, not Axlon compatible). MidiMate features MIDI IN+OUT and SYNC IN+OUT ports, but lacks a second SIO plug. MMS (MIDI Music System) is a MIDI version of AMS, also sold by Hybrid Arts and comes with AMS to MMS converter software...

- "MIDI Master" by 2-Bit Software (UK), comes with hardware+software. Features MIDI IN+OUT ports, an extra SIO plug, but no SYNC ports. See also reviews and ads in (New) Atari User...

- "MIDI interface" by DIGICOMM (UK), comes with hardware + 'example programs'. Features MIDI IN, THRU and OUT ports. There`s no word about a second SIO plug or any SYNC ports. See also reviews and ads in (New) Atari User...

- "MIDIMAX" by Wizztronics (UK), comes with hardware and software. Features MIDI IN+OUT ports and a second SIO plug. The MMS software that comes with MidiMax requires 48k RAM and is fully compatible to the Hybrid Arts hardware+software. This means, one can use the software with both Midi-interfaces or use the interfaces with the software of both vendors...

- "Atari-Midi-Interface" by Karlheinz Metscher (appeared in the german magazine Computer Kontakt June/July 1986, pages 69-75, complete with documentation, schematics and its first program "Midi-Receiver"; in Computer Kontakt October/November 1986 appeared the second program, called "Midi-Disk" - a Midi Recorder and Player program);

- "Midi-Interface for Atari XL/XE" by Ireneusz Kuczek (appeared in the german ABBUC magazine, issue 65, pages 3-6); the paper-mag. includes a schematic for the midi-interface and some translated descriptions for the software (translated from polish to german language), whereas the disk-magazine contains the midi-programs "Midiplay Version 1.3" by I. Kuczek, "Midi-Recorder Version 1.2" by I.Kuczek, "Rec to Mid" by I. Kuczek (a converter program for the IBM-PC!), "Midi-Sequencer V.1.15" by Maciej Sygit and "Midi-Pattern-Editor MPE V.2.3" by Radek Sterba. These programs and many additional demo sounds are also available in the ABBUC PD library (PD numbers 625-632).

- guess there are several other (selfmade) midi-interfaces for the Atari 8Bit available, alas they also require a keyboard or synthesizer and self-created (or downloaded) midi-sounds can only be played back via such a midi-interface and the affore mentioned keyboard/synthesizer. As of yet, it seems there exists no midi-player program, that can playback any midi-sound via the Atari Pokey chip, nor any converter

program, which can convert *.MID sounds into other Atari sound formats
(that could be played back on the Atari then)...

Subject: 6.14) What graphics enhancements are there for the Atari?

This section by Andreas Magenheimer.

- some 80 column interfaces made by Atari and third parties. Allthough
these interfaces are there to provide a better text display with 80
chars. per line, they can somehow be used as a simple graphic
enhancement; think I have seen a graphic demo for the XEP-80 device
somewhere, that used a higher graphic resolution in Gr. 0 or Gr. 8
and also provided some animation (not only text, but also graphics),
alas I don`t remember the name of that demo...;
- the ultra-rare 1090XL box and probably graphic cards for it (who-ever
owns this item, doesn't use it, who-ever would like to have + use it,
doesn't own it or cannot afford it!);
- more seriously: Antic and GTIA upgrade by Chuck Steinman. Afaik, an
article about that topic appeared in Atari Classic, since I do not own
it, I can merely speculate that it adds a second Antic and GTIA for
higher resolution and/or more colours...;
- many selfmade upgrades, using graphic chips or graphic cards from other
computers...

Subject: 6.15) What types of memory upgrades are there for the Atari?

This section by Andreas Magenheimer.

Just a short overview here, for a more detailed description (table), see
also 8.10 kinds of atari ramdisks (and 8.11 + 8.12 for programs that
support or require a ramdisk). The following memory enhancements do exist:
- Atari 400/800: ramdisks on memory boards, that fit into the normal
Atari 800 memory slots (Axlon and Mosaic types);
- Atari XL/XE: a) internal memory enhancements:
- piggy-back versions,
- professionel PCB versions,
- SIMM-module versions;
b) external memory enhancements:
- via XL-Parallel-Bus,
- via XE-Cart.port+ECI,
- Flash-ROM cart. versions,
- other Cartridge versions,
- RAM-Card versions,
- SIO-cartridge versions,
- ...
Note that many of these XL/XE memory enhancements are just hobbyist or
selfmade-projects. Most versions which use newer PC technologies
(Flash-ROM cart., RAM-Card, SIO-cart., etc.) are still under development!

Subject: 6.16) What networking hardware is there for the Atari?

This section by Andreas Magenheimer.

In the late 80`s and early 90`s an american "firm" called Dataque developed some networking-computer-hardware to link two or more Ataris together, so that multiplayer games are possible, where each user has its own computer and tv/monitor screen. The hardware was/is computer independant and will run fine on any Atari 8Bit computer (whereas most software for it will only work on XL/XE computers). During a 3-4 year period of development two different hardware add-ons were developed:

a) Gamelink-1: This hardware was developed in 1989/90. It links two computers together via the joystick ports. It is limited to a maximum of 2 computers and thus 2 or 6 players, meaning one free port per XL/XE computer and 3 free ports per 400/800 computer. However, the few existing games for this hardware merely support 2 players, no matter, which computer you have...

b) Gamelink-2: This hardware was developed in 1991/92. It links 2 to 8 computers together via the SIO-port. One computer will then act as the master and has to boot up the software (from tape, disk, harddisk, etc.) first. Then all other "slave" computers connect to it and boot off of this master computer (one after another of course). In Europe we call this device "Multilink", mostly because of the games written by Bewesoft (Jiri Bernasek) called Multi-Dash, Multi-Race, Multi-Worms. A two-computer link-network can easily be done with one SIO cable, just open the end of the SIO cable and exchange cables number 3 and 5. You now have an easy two-computer (2-4 players) network-cable.

For some available software, that supports this networking-computer hardware, see 8.16 which programs support networking computer hardware...

Subject: 6.17) Can I attach an ISA card to the Atari?

Yes, RoBu (Roland Buhler) of the Stuttgart ABBUC Regional Group has produced project plans for an ISA-Bus Interface for Atari 800XL/130XE Computer, ARGS.
http://www.stud.uni-karlsruhe.de/~un55/Hardware/ISA-Interface/ReadME.html

Carsten Strotmann has released sourcecode showing how to access a Hercules video card with the ISA-Bus Interface.
http://www.strotmann.de/twiki/bin/view/APG/PgmFardwDriverHerc

---

2 XL/XE 05/10/1983 0x1f9cd270 CO61598B
3 800XE 03/01/1985 0x29f133f7 C300717
4 XEGS 05/07/1987 0x1eaf4002 C101687

(?) This information is missing. If someone can supply this info,
please write me an e-mail.

NOTES:
The 400/800 O.S's consist of three ROMs (two 4kB and one 2kB).
The 1200XL contains two ROMs for the OS (8k each), XL/XE's use a single
16k ROM and the 16k XEGS OS is stored in a 32k ROM (together with 8k
BASIC and 8k for Missile Command).

Origins of ROM information
~~~~~~~~~~~~~~~~~~~~~~~~~~
400/800 rev.A NTSC Could exist, since the PAL version exists and
rev.A is mentioned in the rev.B source code.
james adds (3/8/01):
Did exist! My parents bought me an Atari 400 w/ 410 back in 1981 for
entertainment when I was badly injured in a motorcycle accident. A
year or so later I paid good money ($40 USD or so?) to have the OS A
upgraded to OS B.
400/800 rev.A PAL All info found in two Atari 400's and Atari 800
ROM module CX801.P
400/800 rev.B NTSC Information from a ROM dump and the rev.B source
listing. The part numbers were listed in the
catalog from 'Best Electronics'. According to
'Mapping the Atari' rev.B ROMs have a 'B' at the
end of the part number, therefore I figure these
part numbers are from rev.B.

400/800 rev.B PAL Could exist, since the NTSC version exists and
there's some conditional PAL/NTSC assembly in
the rev.B source code
1200XL rev.10 PAL/NTSC All info found in an Atari 1200XL. The XL/XE
rev.2 source code refers to it as rev.10.
'Best Electronics' calls it rev.A.
1200XL rev.11 PAL/NTSC Refered to rev.11 by the XL/XE source code.
'Best Electronics' calls it rev.B.
XL/XE rev.1 All info found in an Atari 600XL
XL/XE rev.2 All info found in an Atari 800XL
XL/XE rev.3 All info found in an 800XE
XL/XE rev.4 All info found in an Atari XE Game System

O.S. Authors and dates
~~~~~~~~~~~~~~~~~~~~~
The following info is from the Atari XL/XE rev.2 source code.

Revision A (400/800)
D.Crane / A.Miller / L.Kaplan / R.Whitehead

Revision B (400/800)
Fix several problems.
M.Mahar / R.S.Scheiman

Revision 10 (1200XL)
Support 1200XL, add new features.
H.Stewart / L.Winner / R.S.Scheiman /
Y.M.Chen / M.W.Colburn 10/26/82

Revision 11 (1200XL)
Fix several problems.
R.S.Scheiman 12/23/82

Revision 1 (600XL/800XL)
Support PBI and on-board BASIC.
R.S.Scheiman / R.K.Nordin / Y.M.Chen 03/11/83

Revision 2 (600XL/800XL)
Fix several problems.
R.S.Scheiman 05/10/83
Bring closer to coding standard (object unchanged)
R.K.Nordin 11/01/83

Vapour-ware
~~~~~~~~~~~
The following OS roms originate from rare Atari 8-bit systems.
Since I don't own any of these (unfortunately), I don't have much
information about these roms. Who can help me?

I've got two 16K rom dumps from the 1450XLD. Both ID's are rev.3.
The first dated 3/23/1984 comes from the 'Pooldisk Too' CD-ROM
(filename: 1540os3.v0) and the second dated 6/21/1984 was send to
me by Nir Dary (filename: os1450.128). Main differences between

these two are in the first 3K ($C000 - $CBFF).

The XL/XE OS rev.3B is from an Atari from Arabia. It's probably based
on rev.3. There are changes in the fonts (Arab characters) and several
patches in the code. More info at:
http://www.savetz.com/vintagecomputers/arabic65xe/

Rev. Found in Size CRC-32 Date

Special thanks to Nir Dary for the rev.2 source code, rom dumps and
the 1200XL. It's in good hands.

~~~~~~
More info on what is maybe either the 1985 or 1987 XL/XE OS versions listed
above. From ST*ZMAGAZINE #36, Sept. 1, 1989 (as reprinted in PSAN Nov 89):
by Mark Elliot, Innovative Concepts
The following changes have been incorporated in the 130XE computer.

The O.S. has minor changes like:
A) The MEMORY TEST (from SELF TESTS) tests the extra 64K now! (in 4 squares)
B) Also, the MEMORY TEST checks the first 48K over TWICE as fast as before!
C) The KEYBOARD TEST has the F1-F4 keys missing on top. (function keys),
although the code that interprets them is probably there (like XEGS).
D) Also, it types out "COPYRIGHT 1985 ATARI" at the keyboard test, when all
tests are done. (compared to COPYRIGHT 1983 ATARI, before)
E) And, the O.S. chip itself, is on a 27256 EPROM, but only half of it is
used! (comprared to the original, which was on a 16K x 8 ROM, 27128 comp.
~~~~~~

Subject: 7.2) What is the ATASCII character set?

ASCII is an acronym for the American Standard Code for Information
Interchange. Pronounced ask-ee, ASCII is a code for representing English
characters as numbers, with each letter assigned a number from 0 to 127. For
~~~~~~

example, the ASCII code for uppercase M is 77. Most computers use ASCII codes to represent text, which makes it possible to transfer data from one computer to another.

The 8-bit Atari computers use a modified version of the ASCII character set called Atari ASCII, or ATASCII.

David Moeser produced this nice translation table.
Piotr Fusik corrected the description of Atari character 5.

ASCII TRANSLATION TABLE -- IBM & ATARI 8-BIT (ATASCII)

Subject: 7.3) What is Atari BASIC?

BASIC is an acronym for Beginner's All-purpose Symbolic Instruction Code. Developed by John Kemeney and Thomas Kurtz in the mid 1960s at Dartmouth College, BASIC is one of the earliest and simplest high-level programming languages, incorporating components of FORTRAN and ALGOL.

In 1978 Atari contracted with Shepardson Microsystems, Inc (SMI) to create a version of BASIC for their upcoming home computers. The following worked together on the project, which resulted in Atari BASIC:

Paul Laughton (author of Apple DOS) - project leader, co-primary contributor
Kathleen O'Brien - co-primary contributor
Bill Wilkinson - floating point scheme design
Paul Krasno - implemented the math library routines following guidelines supplied by Fred Ruckdeschel (author of the acclaimed text, BASIC Scientific Subroutines)
Bob Shepardson - Modified IMP-16 Assembler to accept special syntax tables Paul invented
Mike Peters - keypuncher/computer operator/junior programmer/troubleshooter

Three Revisions of Atari BASIC were produced: A, B, and C:
A - cartridge produced for use with the 400/800/1200XL
B - built-in to the 600XL/800XL, also produced on cartridge

C - built-in to the 800XL(late models)/65XE/130XE/800XE/XE Game System,
also produced on cartridge.

In order to find out what version you are running, at the READY prompt,
enter "? PEEK(43234)"

If the result is: You have Revision: Atari Part#:
162 A CO12402/CO14502
96 B CO60302A
234 C CO24947A

On versions A, B, and C, Greg Miller writes:
"Rev A had a number of bugs, not just the commonly described crash bug.
Rev B fixed most (maybe all, I don't remember) of these, but in the
process, they added a new bug. You see, the crashes were caused by a bug
in one of OSS's memory move routines. When the bug was fixed, the fix
mistakenly applied to a routine that actually worked in Rev A, causing the
new lockup problem.

Rev C differs in only a few bytes. AFAIK, the only change was to remove
the alteration made to the routine that was broken by Rev B.

Also concerning versions A, B and C, Russ Gilbert writes (3 Jul 2002):
"I've got an opinion on this, my opinion is wrong to 95% of Atari users.

B is a re-compile of A. C is a 12 byte patch to B.

I've used Atari BASIC for a millenium (?). B has less hangs and
ridiculous stuff like losing DIMs and stuff. C hangs like a lot. I must
admit I don't have very much experience with C as I go back to B after
using C for a short time.

I prefer B. I know its foibles. Just LIST, NEW, ENTER, SAVE every 5 or
6 SAVEs. Also, 0 REM will help with ENTERs that aren't working (put a
immediate 0 REM line before you ENTER.)"

Subject: 7.4) What are Atari DOS 1, DOS 2.0S, DOS 3, DOS 2.5, and DOS XE?

Here are short descriptions of the various Disk Operating Systems (DOS)
versions produced by Atari for use with their 8-bit computers.

The original Atari DOS shipped with all 810 disk drives from 1979-1981. It
consists of a single file, DOS.SYS, which is loaded into memory from disk on
startup.
At the top of the menu screen it reads:
DISK OPERATING SYSTEM 9/24/79
COPYRIGHT 1979 ATARI
Unless you are a collector, you probably have no reason to work with DOS 1.
Trivia: The "N. DEFINE DEVICE" menu option does not work.
The DOS 1 disk is labeled: Atari 810 Master Diskette (CX8101).

DOS II Version 2.0S was shipped with all 810 disk drives, and early 1050 disk drives, from 1981-1983. It consists of two files:
DOS.SYS is loaded into memory from disk on startup
DUP.SYS, which contains the DOS menu, is loaded only when needed.
MEM.SAV can be employed to preserve the contents of memory to disk when DUP.SYS is loaded, so that the data can be restored to memory when exiting from the DOS menu. DOS 2.0S supports Atari's proprietary single-sided, single density 90K 5.25" floppy disk format only. DOS 2.0S represents the lowest common denominator of Atari DOS versions--you can be assured than any Atari disk drive for the 8-bit Atari can work with disks formatted with DOS 2.0S. DOS 2.0S can read disks written with DOS 1; the reverse is not the case.
The DOS 2.0S disk is labeled: Atari 810 Master Diskette II (CX8104).

DOS II Version 2.0D was shipped with the rare Atari 815 Dual Disk Drive. Supports double-density disk drives; also supports single-density disk drives.
The DOS 2.0D disk is labeled: Atari 815 Master Diskette (CX8201).

DOS 3 shipped with 1050 disk drives from 1983-1985. It was created in part to take advantage of the 1050's Dual-Density capability, by employing a single-sided, enhanced-density 128K 5.25" floppy disk drive format. Atari called this format "dual-density," but the Atari community quickly came to refer to this format as "enhanced-density" to better differentiate it from widely available 3rd-party truly double density disk drives and supporting versions of DOS. DOS 3 uses a disk format incompatible with DOS 2.0S. It included a utility to convert files from DOS 2.0S to DOS 3, but not back again. It used disk space less efficiently than DOS 2.0S. For these reasons and others, DOS 3 was not widely accepted by the Atari community, and like DOS 1 is not generally used except for curiosity's sake.
The DOS 3 disk is labeled: Master Diskette 3 (DX5052).

DOS II Version 2.5 shipped with 1050 disk drives and early XF551 disk drives from 1985-1988. DOS 2.5 represented Atari's relenting to the masses, returning to DOS 2.0S compatability. DOS 2.5 very closely resembles DOS 2.0S, with just a few features added. It supports both DOS 2.0S single-density 90K formats, as well as an enhanced density 128K format for use with the 1050 disk drive. DOS 2.5 also includes a RAMdisk utility for use with the 128K 130XE computer, a utility to convert files from DOS 3 disks back to DOS 2.5, and other disk utilities. DOS 2.5 is just about as universal among Atari users as DOS 2.0S.

DOS XE shipped with XF551 disk drives from 1988-1992. Like DOS 3, DOS XE introduced a whole new format for Atari floppy disks; but unlike DOS 3, DOS XE also preserved general compatability with DOS 2.0S/2.5. DOS XE supports the full capabilities of the double-sided, double density 360K per 5.25" floppy disk XF551 disk drive, including that drive's high-speed burst mode. DOS XE also fully supports the 90K SS/SD capability of the 810 disk drive, the 128K SS/ED capability of the 1050 disk drive, the 180K SS/DD capability of most 3rd-party disk drives for the Atari, and a RAMdisk for use with the 130XE. Date-stamping of files is supported. DOS XE requires an XL or XE computer; it is not compatable with the 400/800 computer models. Even though DOS XE was critically well-received, and represented a substantial jump in capabilities over DOS 2.5, its arrival came so late in the crouded realm of

Atari and 3rd-party DOS versions that it never achieved much acceptance among real users, and is now relegated to the same status as DOS 1 and DOS 3 before it. Before its release, DOS XE was widely known as "ADOS."

Subject: 7.5) What are MyDOS, SpartaDOS, and other popular DOS versions?

Section includes contributions by Andreas Magenheimer (most DOS 2 clone descriptions).

Atari DOS versions are very popular, but many 3rd-party DOS versions have also been developed over the years. Of these, MyDOS and SpartaDOS seem to be the most-used today.

MyDOS 4.53
==========
MyDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support, along with many other "high-end" features.

MyDOS 4.53/3 was released as freeware by David R. Eichel on 1/1/90. Defaults to a 3 character file length/free sector count instead of MyDOS's normal 4. Supports multiple AUTORUNs at boot up (*.AR0 through *.AR9). Supports Axlon RAMdisks.

MyDOS 4.53/4 is the same as 4.53/3, but uses a minimum of four characters in the sector count just like most versions of MyDOS.

MYDOS 4.51 was developed by Wordmark Systems (Charles Marslett). Source code is available as "abandonware" at: http://www.wordmark.org/

MYDOS 4.50 was released on 11/28/88, developed by C. Marslett & R. Puff
http://www.nleaudio.com/css/files/MYDOS45M.ARC

Mathy van Nisselroy's MyDOS page:
http://www-users.rwth-aachen.de/mathy.van_nisselroy/mydos.htm

SpartaDOS 3.2, 3.3, X (4.22)
============================
SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MyDOS disks.

There are many versions available. Hopefully this list will help keep them all straight.

SpartaDOS X (SDX) cartridge

Greatly enhanced/expanded compared to disk- based SpartaDOS; completely different source code. Several versions produced:
4.22 11-05-95 released by Fine Tooned Engineering (FTe)
4.21 7-10-89 released by ICD
4.20 2-06-89 released by ICD
4.19 1-16-89 released by ICD
4.18 10-29-88 released by ICD

4.17 ?-?-88 released by ICD

SpartaDOS Pro 3.3a, 3.3b, and 3.3c - 1994-

The SpartaDOS Pro 3.3 versions were developed by Stephen J. Carden, based upon a dissembled copy of the older (more stable?) 3.2c release from ICD.
-- SpartaDOS Pro Ver 3.3a 3-Nov-94 -- Added MUX support and MS-DOS Commands. Highspeed SIO routines NOT included. Recommended for use in emulators (especially Xformer) only.
-- SpartaDOS Pro Ver 3.3b 25-Dec-95 -- Has two different SIOV handlers, one for the MUX and one for the MIO.
-- SpartaDOS Pro Ver 3.3c 1995 -- Looks at your system and by checking it determines what CIO handler to load, and has MS-DOS command set. Black Box, MUX, and MIO are fully supported, though none of these are required.
-- SpartaDOS Pro Ver 3.3c 19-Dec-97 -- the same 3.3c produced on a 16K ROM cartridge by Video 61.
-- SpartaDOS Pro Ver 3.3d -- exists, but is not in general release

According to Lance Ringquist:
K-Products contracted FTe to develop SpartaDOS Pro 3.3 for exclusive use and distribution with K-Products' BBS Express! Pro, to provide this BBS system with the most stable platform possible. As Video 61 now owns the rights to BBS Express! Pro, SpartaDOS Pro 3.3 is therefore now a product of Video 61.

According to Stephen Carden:
The SpartaDOS Pro 3.3 versions were never owned by K-Products, and are technically shareware owned by FTe, although FTe had no connection with the specific development of the 3.3 versions.

SpartaDOS 3.2g and 3.2gx - Dated 6/4/94.

Last official disk-based versions, released as shareware by Fine Tooned Engineering (FTe), who had purchased the rights from ICD. 3.2g is the primary version; 3.2gx differs only in that it locates the disk buffers under the OS to save RAM. 3.2gx is intended for use in systems that include a PBI device (MIO, Black Box); it is not compatible with BASIC XE or any other programs using RAM under the OS.

First shareware release from FTe: 3.2f.

Earlier major releases from the original developer, ICD: 3.2d, 3.2c, 2.3, 1.1.

Only the SDX cartridges and the original version 1.1 are compatible with the 400/800 computer models; SpartaDOS 2.x, and 3.x require an XL/XE.

Many disk-based SpartaDOS versions are available for download here, Thunderdome, kept by SysOp Fox-1:
http://www7.brinkster.com/atari/ataridl/sdsys.htm

One source of SpartaDOS documentation is Russ Gilbert's page at:
http://my.en.com/~russg/

BW-DOS 1.30 and BW-DOS Update #2 - Released: 12/95 ("BeWe")
==========
Another popular, powerful DOS is BW-DOS, freeware by Jiri Bernasek. (it is pronounced "Bay Vay Dos") which is SpartaDOS compatible. Does not use any speeder internally, but comes with external XF551 speeder. Supports 4 drives and Ramdisk, comes with Ramdisk driver for XE compatible Ramdisks up to 1Megabyte; supports 4 densities: a) Single (90k), b) Enhanced/Medium (130k), c) Double (180k) and d) DSDD (360k); does not use any RAM under OS ROM; unlike SpartaDOS most commands are external, thus the DOS is only 5kbytes short; supports a PAL clock (made by ABBUC regional group "ARGS"); comes with many great utilities (which can also be used with SpartaDOS); paper printed German and disk printed English docs are avaiable; latest version 1.3 is avaiable as Freeware...

The other DOS varieties mentioned below are all, like MyDOS, Atari DOS-2 clones and thus DOS-2 compatible; avaiable as PD or Freeware...

TOP-DOS 1.5+
==========
Carolyn Hoglin writes:
This superior DOS was written by R. K. Bennett of Eclipse Software in Sunnyvale, CA. It was based on Atari DOS, but with many, many more features. It fully supports my double-density, double-sided Astra drives, automatically sensing the proper density and sidedness of both drives 1 and 2. (MYDOS only seemed to do that on drive 1.) Also supported are large ramdisks for Axlon, Mosaic, etc. The latest version was TOP-DOS 1.5+, which came with an excellent manual explaining how to use its powerful capabilities.

SuperDOS 5.1
==========
supports 4 formats SD/ED/DD/DSDD; supports 256k Xtra RAM/RD; supports 4 speeders: Happy+Speedy+XF551+US Doubler and its compatibles; has an AUX.SYS file with option to use / not use RAM under OS ROM; has unfortunately a very slow Ramdisk;

BiboDOS 5.4 and 6.4
==========
3 versions avaiable, one without speeder - 5.4NT, one with Happy/Speedy support 5.4HS and one with XF support 6.4XF; supports 4 formats / up to 360k; supports 256k Xtra Ram / RD; the DUP.SYS uses RAM under OS ROM, thus Turbo-BASIC must load without DUP;

Turbo-DOS 2.1
==========
Master-Disk produces 4 different versions: 2.1NT without speeders, 2.1HS for Happy/Speedy, 2.1XF for XF551 and 2.1EX for 3 speeders: Happy+Speedy+XF551; supports 256k Xtra RAM / RD and supports use of batchfiles; has converter for DOS 3 and DOS 4; supports 4 formats, up to 360k; does not use RAM under OS ROM; DUP uses a Command Processor; all commands are avaiable via HELP key; works with XL/XE computers only, does not load/boot on Atari 400/800 no clue why;

Subject: 7.6) How do I modify Atari DOS to support more than two drives?

Russ Gilbert writes:

DOS 2 type DOSes default to two drives.
Boot DOS and BASIC.
? PEEK(1802)
if it is 3 then you only recognize two drives.
To get the 3rd drive, poke 1802,7. Then go to dup.sys (type DOS)
and write system files. Next time you boot that DOS, you'll recognize
3 drives.
If you want four drives, poke 1802,15.

Subject: 7.7) Are there Graphical User Interfaces (GUIs) for the Atari?

Contributors: Andreas Magenheimer, Mathy van Nisselroy, Kathleen Ferrante

- Diamond GOS version 1 (a cart and a PD demo-disk-version do exist), version 2 (cart only), version 3 (cart only); plus some applications (painter program, text program, etc.); Diamond GOS has been made freeware by the author Alan Reeve;

- G.O.S., the Graphic operating system by Total Control systems; two different versions are avaiable (I call them GOS 1 and GOS 2) and they are PD;

- G.O.E., the Graphic Operating Environment also by Total Control Systems (this one merely works under Sparta DOS, not with Bewe-DOS and not at all with DOS 2.x); so far I have found 3 different versions (GOE 1,2,3) with some applications (graphic/painting program, etc.); PD;

- S.A.M., the Screen Aided Management (unfortunately it has the same name as SAM, the software aided mouth) from PPP/Germany. It is avaiable in two different versions: a) the type-in listing from Atari magazin and/or the Lazy finger disks (which are PD!) or b) the commercial version 2.0 which has many add-ons and can still be bought from Dean Garaghty/UK or PD-World-Versand/Germany; This GUI merely works correct under DOS 2.5 and Medium/dual density, however...

- BOSS-XL, the XL-Desktop from Mirko Sobe; written in Turbo-BASIC; freeware; http://www.atarixle.de/

- BOSS-XE, the XE-Desktop from Mirko Sobe; written in Turbo-BASIC;freeware, http://www.atarixle.de/

- BOSS-X the newest desktop version from Mirko Sobe, needs an 128k+ Computer (128k or more memory), supports MyDOS up to 16MB and MyDOS subdirs...; still written in Turbo-BASIC; many applications and drivers; freeware; http://www.atarixle.de/

- XL-TOS a small and "cheap" GUI version from Atari magazin (i.e. a type-in listing; the BASIC file, which consists of many data lines creates a short object code file); unfortunately this GUI only looks good, it loads almost nothing... PD;

- ST-TOS a small BASIC program, that looks like a GUI; it can merely load BASIC files and do a few DOS commands, like lock, unlock, delete and such... (PD)

- BASIC desktop, a GUI written in BASIC just as a sample, what can be done with an 8-bit computer; this one loads BASIC and text files (maybe also ML files); PD;

- DCS, the desktop construction set from Tom Hunt; there are 3 different versions avaiable, a) for DOS 2.5, b) for MyDOS andc) for Sparta-DOS; I have tested the Sparta DOS version, which worked with batchfiles and could easily load some ML files, text files and BASIC files (which were already on the DCS disk); it also works with high densities and/or hard disk partitions up to 16MB and supports subdirs of course; hmm, freeware or shareware ?!?

- ATOS - GUI by Tom Hunt/Closer To Home. http://cth.dtdns.net/atos/
1) Lets you use any demo or intro as a screen saver!!
2) Works with all Atari hardware, BB, MIO and Hard drives, SpartaDOS support
3) Lets you run files like full games and demos and then
return back to the desktop. It uses Overlays.

- Atari Desktop by ABC software (Poland), includes editors, converters, file copiers, sector copy, tape+turbo tape copy, small games, CMC finder and player and much much more; works with 64k RAM and keyboard input; disk manuals only in polish language...

- Windows XL a Turbo-BASIC GUI with some nice add-ons, like calculator, editor and other things. written in 1986-1988 by Joerg Forg.

- there are a lot more GUI programs, however many of them are written in BASIC or Turbo BASIC and are very restricted; most of them merely look like a GUI but need to much memory for everyday use. Thats why most users still prefer those DOS or Gamedos (Gameloader, Multiloader, etc.) programs...

Subject: 7.8) What should I know about modem device handlers?

In order to use a modem on the Atari, a modem software handler, or R: device handler, must be loaded into memory.

There are several families of R: handlers, corresponding to the different ways in which a modem may be attached to the Atari.

Except for family #7 below, these handlers are used in one of two ways. Either they are (A) loaded into memory from DOS just before running the main terminal application, or (B) the terminal program is appended to the handler, so that in practice, a single file is loaded from DOS which contains both the R: device handler and the application itself.

1) 835/1030/XM301 modems. Atari-only modems, interface via SIO

2) MPP/Supra modems. Atari-only modems, interface via joystick port

3) R-Verter cable. Connect standard Hayes-type modems via SIO
/ SX212 modem. A Hayes-compatible modem, interface via SIO

4) SWP ATR8000 interface. Standard Hayes-type RS232 modems via this interface.

Richard Anderson writes (Oct 2 02):
Mine originally came with a driver program; and, I believe, a BASIC program
to set up the driver from BASIC. Later they shipped with a special version
of MyDOS with the R: handler built in.

5) 850 Interface/P:R: Connection, internal

This type of "mini handler" simply loads the R: device handler code from a ROM
chip inside the RS232 serial interface. A long beep is heard through the
speaker when the handler is loaded into the computer's RAM.

Many varieties of DOS for the Atari include an explicit provision for loading
this type of R: handler into memory from the 850 or compatible interface.

Also, this type of R: handler is automatically loaded when any 8-bit Atari
computer is turned on with a P:R: Connection or powered 850 connected, but no
powered disk drive is present.

6) 850 Interface/P:R: Connection, external

Used with the 850/P:R: Connection in place of these interfaces' built-in
handlers.

7) MIO/Black Box interfaces, internal

These interfaces utilitize the PBI or ECI parallel ports on the Atari. They
include their own R: handlers in ROM, using no computer RAM at all.

8) MIO/Black Box interfaces, external: Len Spencer's Hyperspeed

This handler is "optional" for the Black Box, but "essential" for the MIO
in order to take full advantage of the high-speed hardware handshaking
capabilities of these two interfaces.

Hyperspd.arc is available at http://members.aol.com/lenspencer/atari8.htm

----

Subject: 8.1) What programming languages are available for the Atari?

QS FORTH info from Winston Smith, 3/03

Much work on the FORTH section by MCurrent 4/03, based primarily on:
http://www.strotmann.de/twiki/bin/view/APG/LangForth from Carsten Strotmann

This section is by Freddy Offenga.

What programming languages are available for the Atari?

Revision : 1.8
Date.... : 2002-10-13

==========
The goal is to give information about all available languages
for the Atari 8-bit computer. This information includes:

title, last version, author, date and a short description.
It would also be nice to know how to get it and where to get
more information (like reference cards, reviews and such).

Author: Freddy Offenga
Email : taf.offenga [at] chello.nl (replace " [at] " with "@")
URL : http://members.chello.nl/taf.offenga/atari.htm

==========

There are quite a lot! To get some structure in this section it's
divided into the following categories;

a) ASSEMBLER
b) BASIC
c) C
d) PASCAL
e) LISP
f) FORTH
g) PILOT
h) LOGO
i) All the rest

The following format is used:

- Language titel (medium)
version, year : version, year
author/company : author/company
available..... : where/how to get it
package....... : programs, documentation
features...... : main features
Description.

The question marks (?) indicate that more information is
required about that topic.

Credits
=======
- The Multi-lingual Atari, Analog magazine 45, August 1986
- A bunch of manuals
- Some copy-pasted lines from the Atari 8-bit newsgroup
- umich (University of Michigan Atari archive)
- David Wyn Davies (PL65)
- Kevin Savetz (APX titles)
- Maury Markowitz
- Michael Current
- JT (ValForth)
- Andreas Magenheimer

Revision history
================

1.8
Thanks to Adreas Magenheimer for these updates:
- Added "Mesa-Forth"
- Added "130XE Assembler 4.32"
- Updated "SynAssembler"

1.7
Thanks to Maury Markowitz for these updates:
- Updated "A BASIC Compiler"
- Added "Der BASIC Compiler", "MMG BASIC Compiler"
- Added "Frost BASIC", "TT-BASIC XL"

1.6
Synchronized with Atari 8-bit FAQ May-2002 :
- Added "X-Assembler"
- Added "CTH Fast Basic"
- Added availability for "Deep Blue C"
- Added availability for "Atari Pascal"
- Ignored changes "Kyan Pascal" (need more info)
- Updated "ValForth"
- Updated "Extended fig-Forth"
- Updated "fun-Forth"
- Added "Extended WSFN"
- Removed e-mail addresses
- Added availability for "A65"
- Updated "PL65"

1.0 .. 1.5
Changes not noted.
Old versions are available on request.

a) ASSEMBLER

- 130XE Makro Assembler (disk)
version, year : 4.32, ?
author/company : Torsten Karwoth
available..... : freeware, ABBUC PD #297
package..... : assembler, editor, menu, monitor,
batch enhancement, linker/packer
features..... : macros
Two pass 6502 assembler with integrated menu, editor
and monitor shell for 128KB RAM Ataris. Source format
is derived from Atmas Makroassembler.

- 130XE+ Makro Assembler (disk)
version, year : 2.2, 1992
author/company : Torsten Karwoth
available..... : freeware, ABBUC PD #368
package..... : assembler, editor, menu, monitor,
batch enhancement, linker/packer
features..... : macros
New version with 128KB - 1088KB RAM support.
Two pass 6502 assembler with integrated menu, editor

and monitor shell. Needs extra RAM banks. Source
format is derived from Atmas Makroassembler.

- A65 (disk)
version, year : ?, 1989
author/company : Charles Marslett, WORDMARK Systems
available..... : abandonware, http://www.wordmark.org/
package..... : assembler, manual
features..... : source include
Two pass 6502 assembler. Source format is based on the
Atari Macro Assembler. Assembler source included.

- Alfasm, Turbo-Assembler/16 (disk)
version, year : 1.0, 1990
author/company : Jeff Williams, DataQue Software
available..... : ?
package..... : assembler, docs
features..... : source include
Two pass 6502/65816 assembler.

- Atari Assembler/Editor (cart)
version, year : ?, 1981
author/company : Atari
available..... : ?
package..... : assembler, editor, monitor, manual
features..... : -
Two pass 6502 assembler with integrated editor/monitor

- Atari Macro Assembler (disk) (CX8121)
version, year : 1.0C, 1981
author/company : Atari
available..... : ?
package..... : assembler, editor, debugger, manual
features..... : macros, source include
Two pass 6502 assembler.

- ATasm (disk)
version, year : 0.92, 1999
author/company : Mark Schmelzenbach
available..... : umich
package..... : assembler
features..... : macros, source include, optionally target .XFD
disk images and machine state files (Atari800 / Atari800Win),
conditional assembly. Two pass 6502 portable cross assembler.
Highly compatible with MAC/65.

- Atmas Makroassembler (disk)
version, year : 2, 1985
author/company : Peter Finzel, Hofacker
available..... : ?
package..... : assembler, editor, monitor, manual
features..... : macros

Two pass 6502 assembler with integrated editor/monitor.

- Bibo Assembler (disk)
version, year : ?, 1986
author/company : Compy-shop
available..... : ?
package....... : assembler, editor, monitor
features...... : source include, data include
Two pass 6502/65c02 assembler with integrated editor/
monitor.

- Datasm/65 assembler (disk)
version, year : 2.0, 1981
author/company : DataSoft Inc.
available..... : ?
package....... : assembler, editor, menu, manual
features...... : -
Two pass 6502 assembler.

- EASMD (disk)
version, year : 1.0, 1981
author/company : OSS
available..... : ?
package....... : assembler, editor, monitor
features...... : ?
Two pass 6502 assembler with integrated editor/monitor.

- Fast Assembler (disk)
version, year : 1.5, 1995
author/company : MMMG Soft
available..... : ?
package....... : assembler, editor, disassembler
features...... : ?

- Kasm65 (disk)
version, year : 2.51, 1997
author/company : Ken Siders
available..... : shareware, umich
package....... : assembler, editor, linker, docs
features...... : macros, relocation, source include,
conditional assembly
Two pass 6502 assembler. Relocatable object files are
compatible with ra65. Source format is derived from
the Atari Macro Assembler.

- MAC/65 Macro Assembler (disk|cart)
version, year : 2.00, 1982
author/company : Stephen D. Lawrow, OSS
available..... : ?
package....... : assembler, editor, monitor, manual
features...... : macros, source include
Two pass 6502 assembler with integrated editor/monitor.

Mac/65 is a direct descendant of the Atari Assembler/
Editor (via EASMD).

- MAE (disk)
version, year : .96, 1996
author/company : John Harris
available..... : umich
package....... : assembler, menu, editor, monitor, docs
features...... : macros, source include, data include,
conditional assembly
Two pass 6502/65816 assembler with integrated editor/
monitor. Extra RAM supported.

- NASM65 (disk)
version, year : ?, 1992
author/company : Nat!
available..... : ?
package....... : assembler, linker, librarian
features...... : macros, relocation, source include
One pass 6502 portable cross assembler (initially for
the ST). Highly compatible with MAC/65.

- PC-65 (disk)
version, year : 1.0 beta, 1996
author/company : Jan Feenstra & Freddy Offenga
available..... : -
package....... : assembler
features...... : macros, source include, data include,
boundary directive
Two pass 6502 cross assembler for the PC. The source
format is highly compatible with the ST-65 assembler.

- Quick Assembler (disk)
version, year : 1.0, 1990?
author/company : JBW, Avalon?
available..... : ?
package....... : assembler, editor, menu, debugger
features...... : source include
Two pass 6502 cross assembler with integrated editor.
Very user friendly menu environment.

- Ra65 (disk)
version, year : 1.0, 1989
author/company : John R. Dunning
available..... : public domain, umich
package....... : assembler, linker, librarian
part of cc65 (c-compiler)
features...... : ?

- Synassembler (disk|cart)
version, year : ?, 1982
author/company : Steve Hales, Synapse Soft

available..... : http://www.atariland.com/members/oldatarian/
package....... : assembler, editor, monitor, manual
features...... : source include
Two pass 6502 assembler.

- ST-65 (disk)
version, year : ?, 1991
author/company : A. Stauffenberg, F. Offenga
available..... : -
package....... : assembler, menu shell, manual
features...... : macros, conditional assembly,
source include, data include,
boundary directive
Two pass 6502/65c02 cross assembler for the Atari ST
written in 68000 assembly. As far as I know this is
the first assembler with the boundary directive.

- X-Assembler
version, year : 2.4, 2001
author/company : Piotr Fusik
available..... : freeware
package....... : assembler, docs
features...... : conditional assembly, source include,
binary include, pseudo commands,
pseudo addressing modes
Two pass 6502 cross assembler for PC. The source
format is backward compatible with Quick Assembler.

b) BASIC

- A BASIC Compiler (?)
version, year : 1.05, 1987
author/company : Monarch Data Systems
available..... : ?
package....... : BASIC compiler
features...... : ?

- Advan BASIC (disk)
version, year : ?, ?
author/company : Advan Language Designs
available..... : ?
package....... : BASIC compiler
features...... : ?

- Atari 800 Basic (disk)
version, year : 1.0, 1981
author/company : Microsoft
available..... : ?
package....... : ?
features...... : ?

```
- Atari BASIC (cart)
version, year : Rev.C, 1983
author/company : Atari
available..... : standard ROM in Atari XL/XE
package....... : BASIC interpreter, manual
features...... : pretty plain BASIC implementation

- Atari Microsoft BASIC II (cart)
version, year : ?, 1991
author/company : Atari
available..... : ?
package....... : BASIC interpreter
features...... : ?

- BASIC A+ (disk)
version, year : 3.05, 1981
author/company : OSS
available..... : ?
package....... : BASIC interpreter
features...... : ?

- BASIC XL (cart)
version, year : ?, ?
author/company : OSS
available..... : ?
package....... : BASIC interpreter
features...... : ?

- BASIC XE (cart)
version, year : ?, 1985
author/company : OSS
available..... : ?
package....... : BASIC interpreter
features...... : ?

- CTH Fast Basic (disk)
version/year : ?
author/company : Tom Hunt/Closer to Home
avaiable.......: PD, Freeware or Shareware;
package........: language plus several test files
and examples; english docs;
features.......: faster than Atari Basic, not much
slower than TB, does not use Ram under OS;
avaiable at Tom Hunt's homepage or elsewhere...

- Der BASIC Compiler (?)
version, year : ?, 1983
author/company : Datasoft
available..... : ?
package....... : BASIC compiler
features...... : ?
```

- Frost BASIC (?)
version, year : 1.04, 1985
author/company : Frank Ostrowski, Happy Computer
available..... : ?
package....... : BASIC interpreter, compiler
features...... : ?
Version of Turbo Basic XL that runs on 48k machines (400/800).

- MMG BASIC Compiler 2.0 (?)
version, year : 2.0, 1984
author/company : Special Software Systems
available..... : ?
package....... : BASIC compiler
features...... : ?
It appears that this is a newer version of Der BASIC Compiler,
licensed to some other company.

- TT-BASIC XL (disk)
version, year : 2.11, 1985
author/company : Frank Ostrowski, Happy Computer
available..... : ?
package....... : BASIC interpreter, compiler
features...... : ?
Published in the German magazine "Happy Computer".
Appears to be a newer version of Turbo Basic XL.

- Turbo Basic XL (disk)
version, year : 1.5, 1985
author/company : Frank Ostrowski, Happy Computer
available..... : ?
package....... : BASIC interpreter, compiler (V1.1)
features...... : ?
Published in the German magazine "Happy Computer".

c) C

- ACE C (disk)
version, year : ?
author/company : John Palevich & Ralph Walden
available..... : ?
package....... : ?
features...... : ?
This is a newer version of 'Deep Blue C'.

- C/65 (?)
version, year : ?
author/company : OSS
available..... : ?
package....... : ?
features...... : ?
Probably derived from Dr.Dobbs "Small C". Compiles to 6502
code which emulates the 8080 instruction set.

- C65 (?)
version, year : ?
author/company : Keith Ledbetter
available..... : ?
package....... : ?
features...... : good macro assembler
This compiler does not support structs.

- CC65 (disk)
version, year : 1989
author/company : John R. Dunning
available..... : umich archive,
http://www.umich.edu/~archive/atari/8bit/Languages/Cc65/
package....... : compiler, linker, assembler, librarian
features...... : ?
Public domain compiler. Also used as cross compiler.
Relocatable object linkage files, and the most thorough
K&R C for the 8-bit. Comes with an relocatable assembler.

- CC8 (disk)
version, year : 2.3
author/company : John Palevich & Steve Kennedy
available..... : ?
package....... : Compiler
features...... : ?
ACE C with more "real" C support (e.g. arrays of pointers
to structs). Requires ACE C runtime libs and linker.

- Deep Blue C (disk)
version, year : 1.2, 1982
author/company : John Palevich, APX
available..... : http://www.atariarchives.org/APX/showinfo.php?cat=20166
Source code "Deep Blue Secrets" downloadable at
http://www.atariarchives.org/APX/showinfo.php?cat=20179
package....... : Compiler, Linker
features...... : ?
Deep Blue C was originally an independent product, but it
then became available from APX. It converts C to pseudo-
code and then interprets the pseudo code (8080 instruction
set emulation).
Drawn from Ron Cain's public domain C-compiler (Small-C).

- DVC C (disk)
version, year : 1.05, 1985
author/company : Ralph E. Walden
available..... : ?
package....... : Editor, Compiler, Optimizer, Linker
features...... : Quite user friendly program
The compiler generates special object files (.CCC)
which can be optimized and linked. The package uses a
special DOS called DVC DOS which contains runtime stuff.

- LightSpeed C (disk)
version, year : 1.08, 1986
author/company : Clearstar Softechnology
available..... : ?
package..... : Compiler, Optimizer, Linker
features..... : ?
Runs under CLI DOS's and MENU DOS's.

- Tiny-C
version, year : ?
author/company : OSS
available..... : ?
package..... : ?
features..... : ?
First sold C compiler by OSS. This compiler was used to
compile itself! First true language "bootstrap" on any
8-bit machine (it was also available for Apple and CP/M
machines). Derived from Dr.Dobbs "Small C". Compiles to
6502 code which emulates the 8080 instruction set.

d) PASCAL

- Atari Pascal (disk)
version, year : 1.0, 1982
author/company : APX
available..... : APX-20102
Information at http://www.atariarchives.org/APX/showinfo.php?cat=20102
package..... : ?
features..... : ?
Needs two drives.

- Draper Pascal (disk)
version, year : 2.1, 1989
author/company : Norm Draper
available..... : ?
package..... : ?
features..... : ?

- Kyan Pascal (disk)
version, year : 1986
author/company : Kyan Software, APX
available..... : ?
package..... : editor, compiler, linker, macro-assembler
and manual
features..... : ?
Kyan Pascal would run off a single floppy. The Atari (APX)
version needs two drives. A version which runs entirely in
128k should be available too.

e) LISP

- INTER-LISP/65 (disk)
version, year : 2.1, 1981

author/company : Special Software Systems, DataSoft
available..... : ?
package....... : ?
features...... : ?

f) FORTH

- ES-FORTH
version, year : 1.2, 1984
author/company : The English Software Company
available..... :
http://www.strotmann.de/twiki/bin/view/APG/LangForthESForth
package....... : ?
features...... : says Carsten Strotmann: "Seems to be based an fig-
FORTH,
but with some unique "Words". Works with normal DOS.

- Extended fig-FORTH, (disk)
version, year : 11/10/1981
author/company : Patrick Mullarky, APX
available..... : APX-20029
http://www.atariarchives.org/APX/showinfo.php?cat=20029
package....... : ?
features...... : ?

- Extended fig-FORTH, (disk)
version, year : 1.1 Rev. 2.0, 01/15/82
author/company : Patrick L. Mullarky, APX
available..... : APX-20029
http://www.atariarchives.org/APX/showinfo.php?cat=20029
http://www.strotmann.de/twiki/bin/view/APG/LangForthFigOneOne
package....... : ?
features...... : ?

- fig-FORTH (disk)
version, year : 1.0D
author/company : ?
available..... :
http://www.strotmann.de/twiki/bin/view/APG/LangForthFigOneZeroD
package....... : ?
features...... : ?

- fig-FORTH
version, year : 1/26/81 and 4/01/82 releases
author/company : Steven R. Calfee "Team FORTH"
available..... : ?
package....... : ?
features...... :
http://www.atariarchives.org/APX/showinfo.php?cat=unknown_fig

- fig-FORTH
version, year : 4/10/82

author/company : Peter Lipson / Robin Ziegler "Team FORTH"
available..... : ?
package....... : ?
features...... : based on 4/1/82 release of fig-FORTH by Steve Calfee

- fig-FORTH
version, year : 5/5/82 - 10/16/82
author/company : Harald Striepe "Team FORTH"
available..... : ?
package....... : ?
features...... : based on 4/10/82 release of fig-FORTH by Lipson/Ziegler

- fig-FORTH, Antic (disk)
version, year : 1.4S REV.H, 18Jun85
author/company : John Stanley/Antic Magazine "Team FORTH"
available..... :
http://www.strotmann.de/twiki/bin/view/APG/LangForthAntic
package....... : ?
features...... : based on 10/16/82 release of fig-FORTH by Striepe

- fun-FORTH (disk)
version, year : ?
author/company : Joel Gluck, APX
available..... : APX-20146
http://www.atariarchives.org/APX/showinfo.php?cat=20146
package....... : ?
features...... : ?

- Grafik-FORTH
version, year : 1990
author/company : RAI Production
available..... :

http://www.strotmann.de/twiki/bin/view/APG/LangForthGraphicForth
package....... : ?
features...... : based on fig-FORTH 1.4S and TURBO-GRAPHICS-SYSTEM 256

- MesaForth
version, year : 12/03/81
author/company : ?
available..... :
http://www.strotmann.de/twiki/bin/view/APG/LangForthMesa
package....... : language, source code, documents, examples
features...... : based on 6502 fig-Forth. The major difference is in
the size of the screen on disk (512 bytes instead of
1024 bytes). Runs under ATARI DOS 2.0S.

- QS FORTH
version, year : 1.0, 3/27/81
author/company : James Abanese / [QS] Quality Software
available..... : http://www.strotmann.de/twiki/bin/view/APG/LangForthQS
package....... : Editor, Assembler, I/O routines

Single Density 5.25 Floppy and Manual in Binder
features..... : Editor, Assembler, I/O Routines. based on fig-FORTH.

- turbo-4th
version, year : January 1985
author/company : Steven R. Calfee
available..... : ?
package..... : ?
features..... : compatible with fig-FORTH and Team FORTH. It's fast.
Not threaded, it is a true compiler

- ValForth (disk)
version, year : 1.1, 1982
author/company : Valpar International
available..... : ?
package..... : (8) disks in the set including: 1)master disk,
2)display formatter, 3)text compression and auto text formatting,
4)valDOS-I, 5)valDOS-II, 6)player-missile graphics, character editor and
sound editor, 7)general utilities and video editor, 8) Turtle &
valGraphics and advanced floating point routines.
features..... : based on fig-FORTH

- X-FORTH
version, year : 26 Jan 2003
author/company : Carsten Strotmann
available..... : http://www.strotmann.de/twiki/bin/view/APG/ProjXForth
package..... : binary, source, disk image with samples & editor
features..... : aims to be compatible with new ANSI standard.
works with normal DOS.

g) PILOT

- Atari PILOT (cart)
version, year : 1980
author/company : Atari
available..... : ?
package..... : ?
features..... : ?

h) LOGO

- Atari LOGO (cart)
version, year : 1983
author/company : LCSI, Atari
available..... : ?
package..... : ?
features..... : ?

i) All the rest

- Action! (cart)
version, year : 1983
author/company : OSS

available..... : ?
package....... : compiler, editor, monitor and library
features...... : fast compiler which generates good code
Needs cartridge for runtime procedures. A PD runtime
library is also available.
All variables are static, so recursive routine calls
are not possible. No floating point type (though a
PD library should make this possible). No arrays of
objects (arrays of POINTERS to objects are possible).

- Extended WSFN, WSFN = Which Stands For Nothing
version, year : ?
author/company : Harry Stewart, APX
available..... : APX-20026
package....... : ?
features...... : ?
Info at http://www.atariarchives.org/APX/showinfo.php?cat=20026

- Quick (disk)
version, year : 2.0, 1990
author/company : Raindorf Soft
available..... : ?
package....... : ?
features...... : ?
This is the "poor man's Action!". Same restrictions as
Action! apply also to Quick. Further restrictions are:
only simple assignment expressions, no records and no
pointers.

- PL65 (disk)
version, year : 1.0, 1987
author/company : Noahsoft
available..... : commercial, Extremely rare.
package....... : compiler, editor, library, sample game
features...... : Similar features to Action with same restrictions.
Highly flexible language that includes inline assembler features and
pointers. Robust and well-engineered editor. Does not require
additional runtime library - automatically generated and included in
the compiled code during compilation.

- Test Computer Language (disk)
version, year : 2.2, 1985-1990
author/company : D.Firth
available..... : public domain, ?
package....... : compiler and editor
features...... : ?

Subject: 8.2) What cartridges were released for the Right Slot of the 800?

Contributors: Gene, Larry White, others

Austin Franklin Austin 80 Console Software
Eastern House KISS
Eastern House Monkey Wrench
Eastern House Monkey Wrench II
Geminisoft/Sar-An Magic Dump
Geminisoft Magic Dump II
Radical Systems Cartridge Maker (eprom burner)
Block (first right cart/first "backup" program hardware device)
R-Time 8 ICD (battery-backed clock, for left or right cart slots)
Real Time Cartridge Sunmark, http://www.sunmark.com/

Subject: 8.3) What games support 4 or more simultaneous players?

contributors to this section:
Jeff M Lodoen, Vidar \"Hawk\" Olavesen, Pat Mulvey,
Steven E. Posey (Party Quiz), Andreas Magenheimer

a) The following games support 3 simultaneous players:
(2 players via joystick, 1 player via keyboard)

- Dynakillers by GMG/Slovakia (Freeware!)
- Blastermind by Numbercruncher/Germany (Freeware!)
- M.U.L.E. cracked+changed by CSS/Germany (pirate copy!)
- some more PD and commercial games...

b) The following games support 4-joystick head-to-head play:
(Only the 400 and 800 computer models sport 4 controller ports)

- Asteroids cart. by Atari,
- Basketball cart. by Atari,
- Dandy disk by APX,
- M.U.L.E. disk by ECA,
- Maze War disk or cart. by ???,
- Silicon Warrior disk or tape by Epyx,
- Survivor disk or cart. by Synapse,
- Major League Soccer cart. by Thorn EMI,
- Major League Hockey cart. by Thorn EMI,
- Volleyball by ???
(PD game written in Atari BASIC);
- Tank Battle by ??? from Antic magazine
- Roadblock by Brian Holness from Compute! magazine
- Battle Room (CIA vs. KGB) a PD game by SNACC
- Aliens a PD-game by ??? using an altered Dandy program
(the Dandy font and thus the graphics were changed, however,
the levels remain the same and can be used in both games);
- Sky Warrior by ??? from ROM magazine, June 1984 ***
- Depth Warrior by ??? from ROM magazine, Aug. 1984 ***
- Yellow-Brick-Road by ??? from ROM magazine, Feb. 1984 ***

*** these programs are reported to be 4-player programs, I'm
not sure if they are meant to be 4-players simultaneously
or 4-players - one after another (try to find out!);

c) The following games support 8 players on the 400/800 or 4 on the other computer models, using the 2 controllers-per-port CX30 Paddle controllers:

- Super Breakout by Atari,
- Worms by Electronic Arts
(has nothing to do with the PC game!)

d) The following game supports 4 players on all machines, using special 4-button keypad controllers linked together with RJ-11 jacks (standard phone jacks) to a box with 2 joystick port connectors:

- Party Quiz by Suncom

e) The following programs support multi-joystick games, using extra hardware called Quadrotron (from the german Atari magazin 2/1989):

- test program for 4 joysticks (and assembler source);
- Quadro-Tron by H.Schoenfeld (4-player Tron-clone);

f) The following programs support multi-joystick games, using extra hardware called Multijoy (multijoy4 for up to 4 players, multijoy8 for up to 8 players and multijoy16 for up to 16 players; originally developed by Raster/Radek Sterba, but also available from ABBUC):

- Cervi by R.Sterba (up to 8-players Snake-clone);
- Multijoy by R.Sterba (up to 4 players Tetris-clone)
- Bremspunkt by T.Butschke (up to 4 players Car-race);
- Sheep by F.Dingler (up to 8 players Sheep-race);
- Cards by F.Dingler (up to 8 players grab-a-card-game);
- Ice-Hockey by F.Dingler (up to 8 players Icehockey-game);
- Quadrotron-M4 by R.Sterba (patched Quadro-Tron for Multijoy);
- Shoot Em' All by R.Sterba (16 players shooting-game)

Subject: 8.4) What programs run only on the 400 and 800 models, and why?

The following are reported as incompatible with models other than the original Atari 400/800. Most probably do work on XL/XE's if you use a translator to run the original 400/800 OS on your XL/XE. (Alas, most translator-versions are limited to disk access, thus booting/loading a tape [and especially a cartridge] can be difficult sometimes...A.M.)

Apple Panic Broderbund
Aquatron Sierra On-Line
Astro Chase First Star Software / Parker
Atari Word Processor Atari
(this is not the same as AtariWriter!)
Atlantis (some versions!) Imagic
Attack at EP-CYG-4 (by Bram) Romox

Konrad M.Kokoszkiewicz writes:

XL/XE software won't work on 400/800 if:

1) it uses shadow RAM at $C000-$CFFF and $D800-$FFFF
2) it uses RAM expansions at $4000-$7FFF controlled by PORTB $D301
3) it uses specific XL OS functions (like JNEWDEVC)
4) it uses illegal XL OS addresses.
5) it uses European Charset :)

Andreas Magenheimer adds:
To get an overview or see a chart of OS changes from the 800 to the XL
line, refer to Antic magazine Volume 3, Number 2 (June 1984), pages 10-14;
Also note, that some software will not work correct (or not at all) on
newer XE/XEGS versions (which have a new OS with a new version number,
a new selfttest/memory-test/keyboard-test, larger RAM chips, etc. etc.);

Subject: 8.5) What programs make use of the Light Gun or a light pen?

Bertrand M. (LEXX) writes:

- Bug Hunt cart. by Atari;
- Barnyard Blaster cart. by Atari;
- Crossbow cart. by Atari;
- Crimebuster cart. by Atari;
- Operation Blood disk by ANG/Mirage;
- Operation Blood II - Special Forces disk by ANG/Mirage;
- Light Gun Blaster (PD from Page 6);
- enhanced Lightgun Blaster (PD from Pedrokko);
- Gangsterville disk by Linda Soft
(an italian game written in BASIC);
- maybe a couple more...

James Bradford mentions:
"On the 400, the light gun /pen will only work in joystick port 4."
This renders much light gun and light pen software unusable on the 400.

Andreas Magenheimer adds:
All Lightgun games can be used with a lightpen (which is not as accurate
as a Lightgun however). And all lightpen programs can be used with a
lightgun. thus add:

- Atari Graphics cart. by Atari
(a painting/drawing program);
- Matrix a PD game by Dave Oblad
(a 4-wins or 5-wins clone!)
- Alien Invaders disk by R.Gore (available from DGS);
- Bembelwo a PD game by Thorsten Butschke
(a sort of golf/minesweeper game, written in Quick);
- Sharp Shooter by Mat*Rat a PD game from Analog,
(also available on cart from Video 61/Lance Ringquist);
- Lightgun Shooter by ??? from ABBUC mag.

(a simple shooter game, at least PD!)
- Flyshot or Flyshoot a PD game by Kemal Ezcan
(a Turbo BASIC game from ZONG, the KE Soft magazine);
- Geisterschloss game+editor disk by KE Soft;
- Lightpen Doodle by ??? from Antic magazine;
- some more PD programs and utilities for Lightpen or Lightgun;

Subject: 8.6) What programs have a track ball mode or support a mouse?

Contributors: Andreas Magenheimer, Mirko Sobe

Title Keystroke Required
------------- --------------------
- Missile Command by Atari CTRL-T
- Slime by Synapse [T]
- Shanghai by Activision choose controller type: ST mouse !
(plug it into port 2; if you do not
have one, you have to reboot!!)
- Bombdown by Roemer of Uno choose between Joystick, Amiga
mouse, ST mouse or CX85 numeric
keypad (use port 2 for any mice)
- Minesweeper by Raindorf-Soft use an ST mouse in port 2
- The Brundles by KE-Soft use an ST mouse in port 2
- The Brundles Editor by KE-Soft, PD use an ST mouse in port 2
- Geisterschloss by KE-Soft, PD choose Lightgun (port 1) or ST
mouse (port 2)
- Vanish (ZONG, Vol. 5+6/1993); use an ST-mouse in port 2
- Hong Kong (ZONG, Vol. 5+6/1993); use an ST-mouse in port 2
- Maus-DOS (ZONG 5+6/1993); use an ST-mouse in port 2
- Faecher-Patience (ZONG 1/1993); use an ST-mouse in port 2
- Macao (Zong 5+6/1994); use an ST-mouse in port 2
- Multi-Mouse manager (PD) drivers for mice, TB, etc.
- Multiplayer 2.1 by Madteam supports ST + Amiga mouse in port A
- Unriagh I (german PD adventure) has drivers for ST mouse+Joystick
(stick=port 1, mouse=port2)
- Unriagh II (german PD adventure) has drivers for ST mouse+joystick
(stick=port 1, mouse=port 2)
- little Calculator (AMC-Verlag, PD) uses ST-mouse only (port 2)
- big UPN calculator (PD) uses ST mouse, TB, Touch tab. and
joystick; (there are different COM
files, rename the one you wish to
use to *.EXE; all drivers use port
1 - if I remember correctly)
- Operation Blood (ANG/Mirage) press mouse fire or Select to start
in ST mouse mode (port 2)
- Operation Blood 2 / Special Forces press mouse fire or Select to start
(ANG/Mirage) in ST mouse mode
- Sprint XL (ABBUC Jahresgabe 1992) uses an ST mouse in port 2
- M.O.S. (ABBUC magazine) uses an ST mouse in port 2

- Diamond GOS (Reeve software) all three versions support an ST
mouse in port 2
- S.A.M. (Power per Post) german GUI, supports an ST mouse in
port 2
- G.O.E. (TCS) supports an ST mouse in port 1
- BOSS-X (MS-Software, Mirko Sobe) supports ST-Mouse in Port 2

RE: Missile Command, Andreas writes:
there are many different versions available... I know the old Atari 800
cart version, which works correct with Joystick and Trakball, but not at
all with a mouse. The newer XL version works with Mouse, trackball and
Joystick, also the newest (built-in) XEGS version of MC. But, there is
also a tape version (and maybe a disk version) of MC available. I am not
sure if this tape version behaves like the old 800 version or like the
newer XL and XE/XEGS versions...

And about mice, Andreas adds:
Maybe you did not know, there is a little difference between Trackball
and ST-mouse. Although MC works with both input devices does not mean,
they are the same. they are not !! Connect the TB to an ST computer and
you see: it does not work at all !! You have to do a small conversion to
convert the TB to an ST mouse. (Plans are avaiable from ABBUC, Germany).

Subject: 8.7) What programs have a paddle(s) or Koala Pad mode?

Andreas Magenheimer contributes:

- Super Breakout (Atari) breakout clone
- Live Wire (Analog) tempest clone
- Live wire 2 (Analog) tempest clone
- Planetary Defense (Analog)
- Pong (Antic) Pong clone
- Pong (Analog) Pong clone
- Super Ball (Compy Shop Magazin) Breakout clone
- Arkanoid (Taito/Imagic) Breakout clone
- Koala/Micro-Illustrator (Island graphics/Koala Ware) graphics program
- Chiseler (Antic or Analog) a breakout clone
- Slime (Synapse) a slimy shooter...
- Chicken (Synapse) catch the chicken eggs...
- One on One (Compute!) a breakout/warlords clone
- Paratroop Attack by David Plotkin
- all Pinballs created with the P.C.S.
(use left paddle trigger for left flipper and right paddle trigger for
right flipper; or simply use a joystick and left/right/fire button);
- many more Pong and Breakout clones
(forgot their names, maybe someone can help here!)
- many more programs (which I do not remember right now!)

for Koala Pad only: - Micro-Illustrator / Koala Painter
- other Koala Pad painters or programs

Subject: 8.8) What programs have a CX85 Numerical Keypad mode?

Andreas Magenheimer contributes:

- Bombdown (Roemer of Uno);
- The Bookkeeper (Atari);
- Multi mouse Management (PD);
- UPN calculator (PD);
- Ball Harbour (Zong 8/1992);
- The Big Quest (Zong 7/1992);
- Blob (Zong 2/1992);
- Bomber Jack (KE-Soft);
- Catch (Zong 6/1992);
- Code table (Zong 11+12/1993);
- CX-85-Driver (Zong 7+8/1994);
- CX-85-Keycode-driver (Zong 7+8/1995);
- Donald (by KE-Soft);
- Drag (by KE-Soft);
- Dragon Fire (Zong 1/1993);
- Gravitar (Zong 4/1992);
- Hungry Goblin (Zong 5/1992);
- Invaders (Zong 5+6/1993);
- Joshi (Zong 3+4/1993);
- Lasermaze (by KE-Soft);
- Lost in the Antarctic (Zong 2/1992);
- Mampfman (Zong 8/1992);
- Minipac (Zong 3/1992);
- Minipac 2 (Zong 6/1992);
- Money Raider (Zong 2/1992);
- Monster Tracking (Zong 9/1992);
- Oblitroid (by KE-Soft)
- Pac-Man (Zong 11/1992);
- Schlumpf/Smurf (Zong 5/1992);
- Slurp (Zong 3/1992);
- Techno Ninja (by KE-Soft)
- Transsylvania (Zong 3+4/1993);
- Viro-Mania (Zong 2/1993);
- Zador XL (by KE-Soft)
- Zador II (by KE-Soft)
- many more games from KE-Soft and Powersoft;
(forgot their names, help needed!)

Subject 8.9) What programs have a Touch tablet mode?

Andreas Magenheimer writes:

- Atari Artist (Atari) graphics program
- Pixel Artist Deluxe 1.3 (PD) graphics program
- The Brundles (KE-Soft) Lemmings clone

- Musorqua (Analog computing) educational program
- many more (which I do not remember right now!)

Subject: 8.10) What kinds of RAMdisks can be set up on the Atari?

This section by Andreas Magenheimer.

8.10 Atari Ramdisks - An (incomplete) Overview:
[This is version 2.10 from October 2003]

Right from the start of the Atari 8-bit computer era in the late 70`s, Atari users wanted to have as much RAM as possible (or as their purse could afford). Having a 16k machine with a tape device was nice and cheap, but having full 48k or 64k and a floppy drive was much nicer (and very expensive). Thus many Atari users began to create selfmade RAM extensions and enhancements, just to save some money. Also a lot of firms provided extra RAM, RAM enhancements, RAM extensions and Ramdisks. Besides Atari there were (and still are) quite a lot of producers, manufacturers, distributors and authors of such RAM enhancements...

This "short" and incomplete overview does not provide any docs or manuals, but gives some info about the various Ramdisks on the market. Since these notes are written by me, they will merely contain the information I have. And as you all can see - it is still incomplete. So any help and extra info, as well as corrections, are very welcome. It would be nice to see this text & info growing. For now let us start here, the info-section is divided into 8 groups:

1) Name (Name of the RD, e.g. Megaram 2 or Rambo XL or MIO, etc.);
2) Vendor/Author (or distributor, manufacturer, producer, etc.);
3) Size (size of the Ramdisk only; NOT the full computer memory);
4) [Bankswitching] Area (for XL/XE computers usually 4000-7FFF);
5) Banks (hexadecimal input count, as in MyDOS or RAMDTEST.BIN);
6) Control Bits (which bits are used to control the Rambanks);
7) Port (control Port - usually Port B for XL/XE machines);
8) Notes (any extra info, comments, miscelleanous things, etc.);

If you wish to add any other type of info, let me know. The above information should be enough for most programmers to support a RD in their programs (especially to support more than just one type of RD). Hopefully future programs will take care about this info or just use a small setup program to setup any kind of RD. Now let me begin:

A) Atari 400/800 Ramdisks:

Name Vendor Size Area
Banks Bits Port Notes

- Axlon Axlon/Atari 64k 4000-7FFF
0 thru 3 0,1 (CFFF) plug-in-board

Note: total memory = 96kbytes (32k RAM + 64k RD);

- Axlon Axlon/Atari 128k 4000-7FFF
0 thru 7 0,1,2 (CFFF) plug-in-board
Note: total memory = 160kbytes (32k RAM + 128k RD);

- 288k800 D.Byrd and others 256k 4000-7FFF
0 thru 15 0,1,2,3 (CFFF) selfmade-board
Note: total memory = 288kbytes, Axlon compatible;

- 544k800 various authors 512k 4000-7FFF
0 thru 31 0,1,2,3,4 (CFFF) selfmade-board
Note: total memory = 544kbytes, Axlon compatible;

- 1056k800 various authors 1024k 4000-7FFF
0 thru 63 0,1,2,3,4,5 (CFFF) selfmade-board
Note: total memory = 1056kbytes, Axlon compatible;

- 2080k800 various authors 2048k 4000-7FFF
0 thru 127 0,1,2,3,4,5,6 (CFFF) selfmade-board
Note: total memory = 2080kbytes, Axlon compatible;

- 4128k800 various authors 4096k 4000-7FFF
0 thru 255 0,1,2,3,4,5,6,7 (CFFF) selfmade-board
Note: total memory = 4128kbytes, Axlon compatible;

=> Note that all so-called Axlon "compatible" (256k-4096k) Ramdisks
normally do not homebank when RESET is pressed (a fix should be
available somewhere), whereas original Axlon Ramdisks do homebank
properly !! (Special thanks to Lee Barnes for this note !!)

- Mosaic RAMpower by Mosaic Electronics is actually a Ramboard, that
enhances the memory of your Atari 800; avaiable in 3 sizes: 16k,
32k and 64k (where max. 52k can be utilized from 64k). Looks like
these are no Ramdisks, just (normal/main) RAM enhancements. But maybe
the 64k Ramboard can be patched in some way to gain a small 16k or
32k Ramdisk (48k RAM + 16k RD or 32k RAM + 32k RD) ?!?

- ...

B) Atari XL/XE Ramdisks:

Name Vendor Size
Area Bits Port
Banks
Notes

=> Note that bit 4 is always used in all Port B type memory upgrades to
turn on the CPU's access to the extended memory. Thus, it is not reported
in bit use tables as a used bit as it does not control which bank gets
switched into the 4000-7FFF region. This seems to be a standard convention
as the majority of ramdisk users don't want bit 4 counted as a control bit.

And it's not a control bit - its the 'on' bit. Likewise, bit 5 is the 'on'
bit for ANTIC's access to the extended memory for 'compatible' (to 130XE)
machines as well. If bit 5 does show up in a bit use table, one can only
assume that this is an incompatible machine which doesn't have or use ANTIC
access at all. In that special case, bit 5 is then available for use in
switching in the various banks and thus gets counted as a control bit in
bit use tables. (Special thanks to Lee Barnes for this note !!)

- 130XE-Ramdisk Atari 64k
4000-7FFF 2,3 B ($D301)
Banks: E3,E7,EB,EF;
Notes: old=8kbyte chips (west), new=32kbyte chips (east);
XE`s made in China have faulty GTIAs => replace them!;
XE`s and XEGS made in China also have a new OS which causes
some incompatibility problems (try: Encounter / disk version
by Novagen or try: Muad`Dib-Demo by Hurek, etc.); just replace
the new OS with an older XL/XE one if you want less trouble!;
standard Atari RD - available with all XE-compatible ramdisks;
Antic access: YES! Atari Basic: YES! XL/XE Selftest: YES!;

- 192k-600XL Compyshop 128k
4000-7FFF 2,3,? B ($D301)
Banks: e3,e7,eb,ef,a3,a7,ab,af;
Notes: early CS upgrade version for 600XL only!;
afaik this was a piggy-back version...;
Antic access: no! Atari Basic: YES! XL/XE Selftest: YES!;

- 320k-800XL Compyshop 256k
4000-7FFF 2,3,6,7 B ($D301)
Banks: 23,27,2b,2f,63,67,6b,6f,a3,a7,ab,af,e3,e7,eb,ef;
Notes: afaik this was a piggy-back version...;
Antic access: no! Atari Basic: YES! XL/XE Selftest: YES!;

- 320k-130XE Compyshop 256k
4000-7FFF 2,3,6,7 B ($D301)
Banks: 23,27,2b,2f,63,67,6b,6f,a3,a7,ab,af,e3,e7,eb,ef;
Notes: afaik this was a piggy-back version with sep. Antic!;
(XE meant 130XE only! this excluded 65XE and 800XE!);
Antic access: YES! Atari Basic: YES! XL/XE Selftest: YES!;

- 512k XL various authors 448k
4000-7FFF 2,3,4,5,6,7 B ($D301)
Banks: ef,eb,e7,e3,cf,cb,c7,c3,af,ab,a7,a3,8f,8b,87,83
6f,6b,67,63,4f,4b,47,43,2f,2b,27,23;
Notes: This 512k upgrade is not the same as the one thats on the
British Underground. That one dont work, I had to fix it years ago.
The new version will replace the 64k main RAM with 512k RAM, thus
you gain 64k RAM and 448k Ramdisk. (A.M.: Afaik, it has the same
problems as the 256k RAM enhancements [with 64k RAM and 192k Ramdisk],
meaning *some* programs will try to use the main RAM as rambanks...)
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!;

- A.M. Ramdisk Atari Magazin 256k
4000-7FFF 2,3,5,6 B ($D301)
Banks: 83,87,8B,8F,A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF;
Notes: manual and schematics, as well as a parts list can be found
in german Atari Magazin 2/1987 (includes a Basic test program!);
bugfixes and updates in Atari Magazin 3/1987, 4/1988 and 5/1988;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!;

- Bob Woolley`s Atari 1200XL 1MB upgrade 960k
4000-7FFF 1,2,3,5,6,7 B ($D301)
Banks: EF, ED, EB, E9, E7, E5, E3, E1
CF, CD, CB, C9, C7, C5, C3, C1
AF, AD, AB, A9, A7, A5, A3, A1
8F, 8D, 8B, 89, 87, 85, 83, 81
4F, 4D, 4B, 49, 47, 45, 43, 41
2F, 2D, 2B, 29, 27, 25, 23, 21
0F, 0D, 0B, 09, 07, 05, 03, 01
Notes: this upgrade uses 64k as main RAM and 960k as Ramdisk;
Selftest: Yes!, Basic: "no" (not built-in), Antic access: no! ;

- Mathy`s RD M.v.Nisselroy 1024k
4000-7FFF 0,1,2,3,6,7 B ($D301)
Banks: EF EE ED EC EB EA E9 E8 E7 E6 E5 E4 E3 E2 E1 E0
AF AE AD AC AB AA A9 A8 A7 A6 A5 A4 A3 A2 A1 A0
6F 6E 6D 6C 6B 6A 69 68 67 66 65 64 63 62 61 60
2F 2E 2D 2C 2B 2A 29 28 27 26 25 24 23 22 21 20
Notes: uses a PC-SIMM (30-Pin-SIMM), pin-switching in RD: 4,5;
XL/XE/XEGS: Selftest+Basic=YES, XEGS: Missile Command=YES!;
no use of any switches!; Antic access: YES!; (CS-compatible!);

- Megaram 1 Klaus Peters 256k
4000-7FFF 2,3,6,7 B ($D301)
Banks: 23,27,2B,2F,63,67,6B,6F,A3,A7,AB,AF,E3,E7,EB,EF;
Notes: used 16kbyte Chips x16 (very big/huge pcb);
originally designed (and maybe produced?) by Ralf David;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!

- Megaram 2 Klaus Peters 256k
4000-7FFF 2,3,6,7 B ($D301)
Banks: 23,27,2B,2F,63,67,6B,6F,A3,A7,AB,AF,E3,E7,EB,EF;
Notes: uses 128kbyte Chips x2 (much smaller pcb);
originally designed (and maybe produced?) by Ralf David;
newer MegaRAM version; fully compatible to Megaram 1;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!

- Megaram 1,2 => 512k B.Pahl 512k
4000-7FFF 2,3,5,6,7 B ($D301)
Banks: 03,07,0B,0F,23,27,2B,2F,43,47,4B,4F,63,67,6B,6F,
83,87,8B,8F,A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF;
Notes: upgrade for Megaram 1 or 2 to 512kbytes (which means
a total of 576kbytes memory); requires a small pcb (in
connection with the existing Megaram 1 or 2 pcb) and the
following chips: 2x 414256 (RAM), 1x 74LS138 plus some more

wires inside the computer; additionally one may install a
switch to switch down to 320k or even 64k (no RD!) if needed;
advantage: more RAM, Basic still there, 26AE & 8ACE banks...;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!

- Megaram 3 Klaus Peters 256k
4000-7FFF 2,3,6,7 B ($D301)
Banks: 23,27,2B,2F,63,67,6B,6F,A3,A7,AB,AF,E3,E7,EB,EF;
Notes: uses 256kx4 Chips (514256-70); fully compatible to
K.P./R.D. Megaram 1+2; originally designed by Ralf David;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!

- Megaram 3 Klaus Peters 1024k
4000-7FFF 2,3,6,7 B ($D301)
0,1 (or switches) B ($D600)
Banks: 23,27,2B,2F,63,67,6B,6F,A3,A7,AB,AF,E3,E7,EB,EF;
$D600: F3,F7,FB,FF...
Notes: uses 1Mx4 Chips (514400-70); can be a) 1 Ramdisk of 1 Mb
or b) 2 Ramdisks of 512kb each or c) 4 Ramdisks of 256kb each;
uses four switches; the 1MB mode seems to be very incompatible!!;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!

=> Note that all XL-type Megaram-Ramdisks (Megaram 1, 2, 3)
have Refresh bugs/problems which can be solved quite easily
with one 74LS08 chip (see ABBUC magazine 63, pages 19+20);
None of the Megaram Ramdisks do have the separate Antic access
built-in, but XE-types can be upgraded easily for this mode!!;

- Newell Newell Ind. 192k
4000-7FFF 2,3,5,6 B ($D301)
Banks: a) older version: 83,87,8B,8F,C3,C7,CB,CF,E3,E7,EB,EF;
b) newer version: A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF;
Notes: replaces the 8 RAM 4164 with 8 RAM 41256 and thus uses
64k as main RAM and 192k as Ramdisk/extra RAM (therefore some
RD-testers will see 240k memory or 15 RD-banks which is untrue!);
the older 256k Newell version was not compatible to Rambo XL,
Buchholz and Peterson, since these were not available then;
Newell was earlier on the market than Rambo and Peterson,
while early Buchholz Ramdisks used 32k banks instead of 16k
banks; all this changed with the appearance of the 130XE
and thus Buchholz designed 16k Rambanks and finally Newell
256k Ramdisks became Buchholz/RamboXL/Peterson compatible !!
Atari Basic: YES! XL/XE Selftest: YES! Antic access: YES!

- Newell Newell Ind. 1024k
4000-7FFF 1,2,3,5,6,7 B ($D301)
Banks: 01,03,05,07,09,0B,0D,0F,21,23,25,27,29,2B,2D,2F
41,43,45,47,49,4B,4D,4F,61,63,65,67,69,6B,6D,6F
81,83,85,87,89,8B,8D,8F,A1,A3,A5,A7,A9,AB,AD,AF
C1,C3,C5,C7,C9,CB,CD,CF,E1,E3,E5,E7,E9,EB,ED,EF
Notes: uses 8 pc. 1Mx1 Chips (511000-80); Basic: To be able to
select the internal Basic, connect a toggle switch between ground

and the motherboard where PB1 was removed (PIA `Hole' 11). The switch is not much different than the Option Key, and I found it more versatile. (Wes Newell) => see also ABBUC mag. 29, page 6+7; Atari Basic: yes/no! XL/XE Selftest: YES! Antic access: YES!

=> Note that so-called "Newell-compatible" Ramdisks (clones or selfmade ones...) most likely do NOT have Antic access, due to the lazyness of its creators or their intentions of simply not needing it. However, original Newell Ramdisks created and sold by Wes Newell do have the separate Antic access !!

- Newell Newell Ind. 4096k
4000-7FFF 0,1,2,3,4,5,6,7 B ($D301)
Banks: 00,01,02,03,04,05,06,07,08,09,0A,0B,0C,0D,0E,0F
10,11,12,13,14,15,16,17,18,19,1A,1B,1C,1D,1E,1F
20,21,22,23,24,25,26,27,28,29,2A,2B,2C,2D,2E,2F
30,31,32,33,34,35,36,37,38,39,3A,3B,3C,3D,3E,3F
40,41,42,43,44,45,46,47,48,49,4A,4B,4C,4D,4E,4F
50,51,52,53,54,55,56,57,58,59,5A,5B,5C,5D,5E,5F
60,61,62,63,64,65,66,67,68,69,6A,6B,6C,6D,6E,6F
70,71,72,73,74,75,76,77,78,79,7A,7B,7C,7D,7E,7F
80,81,82,83,84,85,86,87,88,89,8A,8B,8C,8D,8E,8F
90,91,92,93,94,95,96,97,98,99,9A,9B,9C,9D,9E,9F
A0,A1,A2,A3,A4,A5,A6,A7,A8,A9,AA,AB,AC,AD,AE,AF
B0,B1,B2,B3,B4,B5,B6,B7,B8,B9,BA,BB,BC,BD,BE,BF
C0,C1,C2,C3,C4,C5,C6,C7,C8,C9,CA,CB,CC,CD,CE,CF
D0,D1,D2,D3,D4,D5,D6,D7,D8,D9,DA,DB,DC,DD,DE,DF
E0,E1,E2,E3,E4,E5,E6,E7,E8,E9,EA,EB,EC,ED,EE,EF
F0,F1,F2,F3,F4,F5,F6,F7,F8,F9,FA,FB,FC,FD,FE,FF
Notes: uses 8 pc. 4Mx1 Chips (541000-80); made by Newell, later by FTE; seems to be very incompatible to existing software and bankswitching cartridges (OSS, Atari, etc.), because normal RAM at 4000-7FFF is NOT available - only extra Ram/Ramdisk banks. With one PIA chip there is simply no bit left to switch between main RAM and extra RAM / Ramdisk. But with the installation of a second PIA chip one would be able to do so. Furthermore one may use (almost) any setup or banks he likes then (with a second PIA chip one could control up to 256 Megabytes of RAM). Basic: To be able to select the internal Basic, connect a toggle switch between ground and the motherboard where PB1 was removed (PIA `Hole' 11). The switch is not much different than the Option Key, and I found it more versatile. (Wes Newell); OS: It is possible to maintain OS bankink using 4 Megs. It requires moving the OS into RAM before any banking of that Bit occurs. Use MOVEOS File on the [Newell-Software-] Disk. (Wes Newell) Atari Basic: no! XL/XE Selftest: no (?) Antic access: no!

- Peterson 256k S.Peterson 192k
4000-7FFF 2,3,5,6 B ($D301)
Banks: A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF;
Notes: compatible to Buchholz, Rambo XL and newer Newell versions; replaces the 8 RAM 4164 with 8 RAM 41256 and thus uses 64k as main RAM

and 192k as Ramdisk (most RD-testers will therefore see 240k memory);
Antic access: no!, Atari Basic: YES!, XL/XE Selftest: YES!

- Peterson 320k S.Peterson 256k
4000-7FFF 2,3,5,6 B ($D301)
Banks: 83,87,8B,8F,A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF;
Notes: compatible to TOMS (?), incompatible to Compyshop!;
there are still the 64k main RAM plus this 256k extra RAM;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!

- Peterson 576k S.Peterson 512k
4000-7FFF 1,2,3,5,6 B ($D301)
Banks: 81,83,85,87,89,8B,8D,8F,A1,A3,A5,A7,A9,AB,AD,AF,
C1,C3,C5,C7,C9,CB,CD,CF,E1,E3,E5,E7,E9,EB,ED,EF;
Notes: should be fully compatible to TOMS-Ramdisk (?);
Atari Basic: no! XL/XE Selftest: YES! Antic access: no!

- Peterson 1088k S.Peterson 1024k
4000-7FFF 1,2,3,5,6,7 B ($D301)
Banks: 01,03,05,07,09,0B,0D,0F,21,23,25,27,29,2B,2D,2F
41,43,45,47,49,4B,4D,4F,61,63,65,67,69,6B,6D,6F
81,83,85,87,89,8B,8D,8F,A1,A3,A5,A7,A9,AB,AD,AF
C1,C3,C5,C7,C9,CB,CD,CF,E1,E3,E5,E7,E9,EB,ED,EF
Notes: fully compatible to Newell and TOMS (?) Ramdisks;
Atari Basic: no! XL/XE Selftest: YES! Antic access: no!

=> Note that (separate) Antic access can be done to all Peterson
and compatible XE-type Ramdisks; just refer to Ed Bachman`s fine
article (supplied with the manual for the Wedge) on how to
update/upgrade your Peterson or compatible Ramdisk for Antic access;
(Afaik only XE-type computers can be upgraded for separate Antic
access, since XL-type computers don`t have the Freddie and Gate
Array chips; the Freddie chip controls the Gate-Array chip; the
Gate-Array chip is responsible for the separate Antic mode...)

- Quarter-Mega-XL C.Buchholz 192k
4000-7FFF 2,3,5,6 B ($D301)
Banks: A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF (=newer version);
Notes: compatible to Peterson, Rambo XL and newer Newell versions;
replaces the 8 RAM 4164 with 8 RAM 41256 and thus uses 64k as main RAM
and 192k as Ramdisk (therefore most RD-testers will see 240k memory);
older versions were designed for 32k banks, but with the appearance of
the 130XE as the new standard, the design had been changed to 16k banks;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!

- Rambo XL ICD 192k
4000-7FFF 2,3,5,6 B ($D301)
Banks: A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF;
Notes: compatible to Buchholz, Peterson and newer Newell versions;
replaces the 8 RAM 4164 with 8 RAM 41256 and uses 64k as main RAM and
192k as Ramdisk (therefore most RD-testprograms will see 240k memory);
built in Atari Basic: YES!, XL/XE Selftest: YES! Antic access: no!

- Rambo=>512k Dan Schmid 512k
4000-7FFF 2,3,5,6,7 B ($D301)
Banks: 00,04,08,0C,20,24,28,2C,40,44,48,4C,60,64,68,6C, (Basic
80,84,88,8C,A0,A4,A8,AC,C0,C4,C8,CC,E0,E4,E8,EC; on??)
Notes: this "project" should upgrade a Rambo XL to 576kbytes;
the docs were found on Pooldisk Too (SUBDIR: ACE/Acec202 a+b);
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no (?)

- Satantronic`s 1MB PC-SIMM Ramdisk 1024k
4000-7FFF 1,2,3,5,6,7 B ($D301)
Banks: 01,03,05,07,09,0B,0D,0F,21,23,25,27,29,2B,2D,2F
41,43,45,47,49,4B,4D,4F,61,63,65,67,69,6B,6D,6F
81,83,85,87,89,8B,8D,8F,A1,A3,A5,A7,A9,AB,AD,AF
C1,C3,C5,C7,C9,CB,CD,CF,E1,E3,E5,E7,E9,EB,ED,EF
Notes: Extended RAM is not available from BASIC. But with a small
patch it is possible to access 512 KB from Basic. This is compatible
with 256 KB and 1024 KB SIMM modules. There also exists some light
modified version of this RD with some switches for better
compatibility with some "old" software. (XI of Satantronic);
Atari Basic: no! XL/XE Selftest: YES! Antic access: no!

- TOMS-RD T.O. + M.S. 256k
4000-7FFF 2,3,5,6 B ($D301)
Banks: 83,87,8B,8F,A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF;
Notes: made+standard in Poland; supported in most polish demos;
should be fully compatible to A.M. and Scott Peterson Ramdisks (?);
Atari Basic: YES!, XL/XE Selftest: YES!, Antic access: no (?);

- TOMS-RD T.O. + M.S. 512k
4000-7FFF 1,2,3,5,6 B ($D301)
Banks: 81,83,85,87,89,8B,8D,8F,A1,A3,A5,A7,A9,AB,AD,AF,
C1,C3,C5,C7,C9,CB,CD,CF,E1,E3,E5,E7,E9,EB,ED,EF;
Notes: should be fully compatible to S.Peterson Ramdisk (?)
Atari Basic: no! XL/XE Selftest: YES! Antic access: no! (?)

- TOMS-RD T.O. + M.S. 1024k
4000-7FFF 1,2,3,5,6,7 B ($D301)
Banks: 01,03,05,07,09,0B,0D,0F,21,23,25,27,29,2B,2D,2F
41,43,45,47,49,4B,4D,4F,61,63,65,67,69,6B,6D,6F
81,83,85,87,89,8B,8D,8F,A1,A3,A5,A7,A9,AB,AD,AF
C1,C3,C5,C7,C9,CB,CD,CF,E1,E3,E5,E7,E9,EB,ED,EF
Notes: should be compatible to Newell & S.Peterson (?)
Atari Basic: no! XL/XE Selftest: YES! Antic access: no (?)

C) Parallel-Bus-Devices:
(600XL/800XL = parallel bus, XE = cart-port + ECI and/or adapter)

- Turbo Freezer XL Bernhard Engl 256k
4000-7FFF 2,3,4,5,6 B ($D301)
Banks: E3,E7,EB,EF,93,97,9B,9F,A3,A7,AB,AF,B3,B7,BB,BF;
Notes: The Turbo Freezer XL is an external device for the XL-PBI

with its own Operating-Sytem. It has a built-in Freezer, Monitor
and DOS. The Antic access for the RD can simply be built with one
wire from CPU to PBI. The RD Access works with Port-Bits 2,3 for
Bank Switching, Bits 4,5 for Groups and Bit 6 for "Mode-Select".
PortB D7 = Selftest (0=on)
D6 = Mode (1 = XE, 0 = Groups)
D5 = XE: ANTIC-Access (0 = on), Groups: Group H
D4 = XE: CPU-Access (0 = on), Groups: Group L
D3 = Bank Number H
D2 = Bank Number L
D1 = BASIC ROM (0 = on)
D0 = OS ROM (0 = off)
Atari Basic: YES! XL/XE Selftest: YES! Antic access: optional;

- missing info for the following Ramdisks:
other Bob Woolley Ramdisks, more 600XL Ramdisks, Rambo XL (512k by
ICD), some Irata Ramdisks, MIO, as well as many other types;
- (?) means: info is missing or I am not absolutely sure about this
information; so this has to be verified by other Atarians;

For this 20th edition special thanks and credits go to: Lee Barnes,
Russ Gilbert, Mathy van Nisselroy, Erhard Puetz, Mathias Reichl,
Ron Hamilton, Wes Newell, Guy Ferrante, XI of Satantronic, Bernhard
Pahl and Walter Lojek for sharing their info with me. Also thanks to
John Picken for writing an excellent article about ramdisks and
cartridges (especially about bank-switching, which both devices can
do). And thanks to Jindrich Kubec (Jindroush) for presenting this fine
article on his homepage... Finally thanks to Michael Current for
publishing/including this "spam" in his A8FAQ and all the nice Atarians
at comp.sys.atari.8bit for their help and patience. -Thank you Folks !!-
Well, thats it for today - there is still a lot of information missing,
I know, but any help is appreciated. If you have some more information
or other things that might help, let me know. Please do also send
corrections since there will always be some updates and corrections
nescessary. Atarian Greetings - Andreas Magenheimer.

Subject: 8.11) What programs support a RAMdisk?

This section by Andreas Magenheimer.

8.11 Ramdisk-supporting Software:
(This is Version 2.10 from October 2003)

Well, I will only list those programs here that have BUILT-IN! ramdisk
support. Why? Simply, because most if not all PD programs can support
a RD, as soon as the user a) has a certain DOS or RD driver or b) has
a special OS inside the computer or c) has any kind of special and
non-standard hardware. Just one example: With the use of QMEG+ OS it
is possible to freeze ZORK (or any other protected / unprotected program)

into the RD, then re-direct the RD as being drive 1 and finally boot
Zork off of the Ramdisk, allthough Zork does not support a RD in any way.
The same funny things can be done to other copy protected programs and
especially to unprotected public domain programs... Now, let me begin:

A) DOS programs:

a) Name(s) b) Author(s)
c) RD-type(s) d) max. size

- Atari DOS 2.0 (Atari Corp.) OSS/Atari;
a) Axlon-RDs (selfmade drivers!) 128k;
b) XE-RDs (selfmade drivers!) 130XE (=64k);
(there are some more selfmade RD-drivers available!)

- Atari DOS 2.5 (Atari Corp.) OSS/Atari;
a) 130XE-RD (standard driver!) 64 kbytes;
b) XE-RDs (selfmade drivers!) max. 2x128 kbytes;
c) Axlon-RDs (selfmade drivers!) 128 kbytes;
(there are very many selfmade RD-drivers available!)

- DOS 3.0 (Atari Corp.) ???/Atari;
=> there should be some selfmade drivers for 130XE Ramdisks (and
maybe Axlon), but I have not yet seen any (nor used DOS 3);

- DOS 4.0 (Atari/Antic) Michael Barall;
=> there should be some selfmade drivers for 130XE Ramdisks (and
maybe Axlon), but I have not yet seen them (nor used DOS 4);

- Bewe-DOS Bewesoft/J.Bernasek;
a) XE-RDs (standard driver!) up to 1024 kbytes;
b) Rambox (standard driver!) up to 256 kbytes;
(Bewe-DOS is compatible to Sparta-DOS but does not use the RAM
under the OS ROM! many tools can be used under both DOS versions);

- Bibo DOS Compyshop/E.Reuss;
a) XE-RDs (standard driver!) up to 256 kbytes;
b) other RDs (selfmade drivers!) up to 256 kbytes;

- DOS II+D Version 6.x Stefan Dorndorf;
a) XE-RDs (standard driver!) max. 2x128 kbytes;
b) Rambox (selfmade drivers!) up to 256 kbytes;

- DOS-XE (Atari Corp.) ???/Atari;
a) 130XE-RD (standard driver!) 64 kbytes;
b) other RDs (really?!?) unknown;
=> has the same author as the unpopular (Atari) DOS 3.0 !!;
(in the Atari scene it is as unpopular as DOS 3 and DOS 4!);

- DOS-XF (Atari Germany) Reitershan Comp.
=> similar in function to Turbo-DOS 2.1XF (but with a nice
DOS 2.0 / 2.5 DUP-menu!) => see Turbo-DOS !!

- My-DOS 4.5x Wordmark/R.Puff+C.Marslett
a) XE-RDs (standard driver!) up to 1024 kbytes;
b) Axlon-RDs (standard driver!) up to ??? kbytes;
c) other RDs (MIO, BB, etc.) up to 1024 kbytes?;

- Smart-DOS Version 6.1 Ron Bieber;
a) XE-RDs (selfmade drivers!) up to 64 kbytes;
b) Axlon-RDs (selfmade-driver!) up to 128 kbytes;

- Sparta-DOS 1.x (400/800) ICD;
a) Axlon-RDs (??? drivers) up to 128 kbytes;
b) other RDs (??? drivers) up to ??? kbytes;

- Sparta DOS 2.x, 3.x (XL/XE) ICD / FTE;
a) XE-RDs (standard drivers!) up to 1024 kbytes?;
b) others (MIO, BB, etc.) up to 1024 kbytes?;
(maybe also RD-drivers for up to 16 Megabytes ?!?)

- Sparta DOS 3.3x (XL/XE) Stephen J. Carden;
=> see Sparta DOS 2.x and 3.x !!
(especially made for use with BBS-Express-Pro!)

- Sparta DOS X / 4.x (XL/XE cart.) John Harris/FTE;
=> see Sparta DOS 2.x and 3.x !!
(maybe with RD-driver for up to 16 Megabytes ?!?)

- Super DOS 2.x Paul Nichols;
a) XE-RDs (standard driver!) up to 128 kbytes;
b) Axlon-RDs (standard driver!) up to 128 kbytes;

- Super DOS 5.x Paul Nichols;
a) XE-RDs (standard driver!) up to 256 kbytes;
b) Axlon-RDs (standard driver!) up to 128 kbytes;

- Top-DOS 1.x R.K. Bennett
a) Axlon-RDs (standard driver!) up to 128 kbytes;
b) 130XE-RD (standard driver!) 64 kbytes;
c) other RDs (Mosaic?! driver!) up to ??? kbytes;

- Turbo-DOS 1.x, 2.x Reitershan Comp.;
a) XE-RDs (standard driver!) up to 256 kbytes;
b) other RDs (MIO, Irata, etc.) up to 256 kbytes;

- X-DOS 2.x Stefan Dorndorf;
a) XE-RDs (standard driver!) up to 256 kbytes;
b) other RDs (selfmade drivers!) up to 256 kbytes;

B) Non-DOS programs:

a) Name(s) b) Author(s)
c) supported memory d) RD-type(s)

- A-Base 130XE (TOOL) ??? (author unknown);
64k, 128k 130XE-Ramdisk;

- ABBUC-Magazine-Intro 52 (DEMO) Karolij N./Heaven
64k, 128k 130XE-Ramdisk
(has different intros on 64k / 128k machines!)

- ABBUC-Magazine-Intro 55 (DEMO) Karolij N./Heaven
64k, 128k 130XE-Ramdisk
(with different intros on 64k / 128k machines!)

- Adalmar (GAME) F.Buettner (PPP);
64k, 128k 130XE-Ramdisk;

- Alphasys-Sample-Software (TOOLs) (Mirage+ANG);
a) 64k, 128k 130XE-Ramdisk;
b) 320k 26AE = YES!, 8ACE = ???;
(there are several programs for 64k or 128k memory; there
is also one -and only one- program for 320k Ataris)

- Anime 4ever (DEMO) Sente-Software-Group;
64k, 320k 26AE ???, 8ACE ??? ;
(on 64k Ataris all pics load from disk, on 320k Ataris from Ramdisk)

- A.R.-The Dungeon (GAME) P.Price/Datasoft;
48k, 64k, 128k 130XE-RD;

- A-Text (TOOL) ??? (author unknown);
64k, 128k 130XE-RD;

- Atari-Writer-80 (TOOL) (Atari);
48k, 64k, 128k 130XE-RD;

- Atari-Writer-Plus (TOOL) (Atari);
48k?, 64k?, 128k 130XE-RD;

- Basic-XE (TOOL) OSS/ICD/FTE
64k, 128k 130XE-RD;

- Bop N'Wrestle (GAME) (Mindscape)
64k, 128k 130XE-RD
(on 64k Ataris the floppy will never stand still!)

- [The] Brundles (GAME) A.R.+C.S.S. (KE-Soft);
64k, 128k, 192k, 320k 130XE-RD, AE & 26AE Ramdisks;
(merely copies the levels into the RD and loads them from there;
if you don't want to play all 100 levels at once, 64k is enough!)

- Datei 4.x (database TOOL) Norbert Schlia;
64k, 128k, 192k, 320k 130XE-RD, AE & 26AE Ramdisks;

- Desktop Atari (TOOL) H.B.S.F
64k, 128k RAM 130XE-RD;
(the Key "7" in the Main Menu copies the whole program into the RD)

- Diskcomm. 2.x, 3.x (TOOL) Robert "Bob" Puff;
a) extra RAM (answer with Yes) detects up to 10 banks (hex.)?;
b) Ramdisk (answer with No) all DOS 2, My-DOS and Sparta RDs;
(Ramdisk size depends on the DOS and RD driver you are using, i.e.

with TurboDOS up to 256k, with MyDOS or Sparta maybe up to 1 Megabyte)

- Diskworker 130XE (Tools) PETSOFT
64k, 128k RAM 130XE-RD;

- Extended-Atari-Basic (TOOL) ??? (author unknown);
64k, 128k (RAM under OS-ROM!) 130XE-RD;

- Extended-Turbo-Basic (TOOL) ??? (author unknown);
64k, 128k (RAM under OS-ROM!) 130XE-RD;

- Fampy 2.3 (Bootdisk; TOOL) Friday-Soft/W.Freitag;
64k, 128k, 192k, 320k 130XE-RD, AE & 26AE Ramdisks;

- Fampy 6.1i+ (ML-File; TOOL) Friday-Soft/W.Freitag;
64k, 128k, 192k, 320k 130XE-RD, AE & 26AE Ramdisks;

- Grafik+Sound Demo (DEMO) Dendrit-Soft/P.Sabath;
(48k?) 64k, 128k 130XE-Ramdisk;

- Howfen-DOS 3.x, 4.x (TOOL) ??? (author unknown);
48k, 64k, 128k and more 130XE-RD and more;

- Howfen-Tape-to-Disk (TOOL) ??? (author unknown);
48k, 64k, 128k and more 130XE-RD and more;

- Human Torch & The Thing Questprobe (SAGA+Marvel);
48k/64k, 128k RAM 130XE-Ramdisk
(The main program or some pics will be copied to the Ramdisk)

- Inertia 2.9 (TOOL) Mad Team;
a) 64k RAM (16k only) 16k usable memory (1 bank);
b) 128k RAM (16k+64k) 130XE-Ramdisk; (5 banks);
c) 320k RAM (16k+256k) 26AE & 8ACE RDs (17 banks);

- I.K. Plus Demo (GameDEMO) ??? (authors unknown)
a) 64k RAM only graphics;
b) 128k RAM graphics + sound;

- Megablast 1 (GAME) Thorsten Karwoth;
64k, 128k 130XE-Ramdisk;

- Midi-Mate II (Tool) Hybrid Arts;
64k, 128k 130XE-Ramdisk;

- Midi-Pattern-Editor (TOOL) Raster/Radek Sterba;
64k, 128k, 320k 130XE-RD, 26AE & 8ACE-RDs?;

- Midi-Player (TOOL) Ireneusz Kuczek;
64k, 128k, 320k 130XE-RD, 26AE & 8ACE RDs?;

- Midi-Recorder (TOOL) Ireneusz Kuczek;
64k, 128k, 320k 130XE-RD, 26AE & 8ACE RDs?;

- Midi-Sequencer (TOOL) Maciej Sygit;
64k, 128k, 320k 130XE-RD, 26AE & 8ACE RDs?;

- MSC-IDE interface software (TOOLs) M.Belitz+S.Birrmanns;
64k, 128k 130XE-Ramdisk
(some programs/drivers use the Ramdisk, if no Ramdisk is
available, they will use & erase the RAM area 4000-7FFF)

- [The] Muppet-Movie (DEMO) Mad Team;
64k, 128k 130XE-Ramdisk;
(on 128k Ataris some pics are loaded from the Ramdisk)

- [The] Page Designer (TOOL) XLent
64k, 128k 130XE-Ramdisk;

- Paperclip II (TOOL) Batteries Included;
48k?, 64k, 128k 130XE-Ramdisk;

- Questprobe featuring Spiderman - see: Spiderman;
(afaik, THE HULK does not support 128k RAM);
- Questprobe featuring Human Torch and Thing - see Human Torch;

- Spiderman Questprobe (SAGA+Marvel);
48k/64k, 128k RAM 130XE-Ramdisk;
(The main program or some pics will be copied to the Ramdisk)

- Sweet Fantasy (DEMO) Tight;
64k, 128k 130XE-Ramdisk;
(on 128k machines the gr.9 pics are loaded from the ramdisk,
on 64k Ataris the gr.9 pics are loading from the disk drive);

- Syncalc "+" (TOOL) Synapse;
48k, 64k, 128k RAM and more Axlon-Ramdisks;

- Synfile "+" (TOOL) Synapse;
48k, 64k, 128k RAM and more Axlon-Ramdisks;

- Synhome "+" (TOOL) Synapse;
48k, 64k, 128k RAM and more Axlon-Ramdisks;

(other programs by Synapse should also support Axlon-Ramdisks)

- Textpro 5.x (TOOL) Ronnie Riche;
48k, 64k, 128k and more 130XE-RD, 26AE & 8ACE RDs;
(here the RD-bank Macros *.ADN and/or *.BNK will require extra RAM
/ Ramdisk; simply don`t use them if you merely have 48k or 64k !!)

- The Browser (TOOL) CTH / Tom Hunt;
64k, 128k and more all Sparta-DOS Ramdisks;

- The Top-3 Demo (DEMO) W.F.M.H.;
64k, 128k 130XE-Ramdisk;
(the dancing girl -"Veronika"- supports 64k and 128k memory!)

- Typesetter XL/XE (TOOL) XLent;
64k, 128k 130XE-Ramdisk;

- [The] X-Files Shpoon;
64k, 128k, 320k 130XE-RD, 26AE or 8ACE RDs?;

- thats all I remember right now...

Note: - Axlon means any Axlon compatible Ramdisk;
- 130XE means 128k memory (64k RAM + 64k RD);
- AE means 192k memory (64k RAM + 128k RD);
- 26AE means 320k memory (64k RAM + 256k RD)
=> Compyshop types (and compatibles, like Mathy`s RD);
- ACE means 256k memory (64k RAM + 192k RD)
=> Newell, Buchholz, Peterson, Rambo XL (and compatibles);
- 8ACE means 320k memory (64k RAM + 256k RD)
=> Newell?, TOMS, Peterson, Rambo XL? (and compatibles);
- ? means I am (generally) unsure -or:- I am not sure if
the given information is correct (just check it out!);

Thats all for now. Thanks and credits go to Russ Gilbert, Lee Barnes
Bernhard Pahl and Mathy van Nisselroy for sharing some info with me.
Any further help or info is welcome !! -Andreas Magenheimer.

Subject: 8.12) What programs require a RAMdisk?

This section by Andreas Magenheimer.

8.12 Atari-programs that require Extra-RAM / Ramdisk:
[This is version 2.10 from October 2003]

A) Non-Demo-Programs:

a) name(s): b) author(s):
c) memory (min.): d) RD-Type(s):
e) notes

- 130XE-(Bank-)Tester (TOOL) various authors (PD);
128k memory (64k RAM + 64k RD) 130XE-Ramdisk (E3,E7,EB,EF);
(1 block with 4 banks, overall: 4 banks);

- 192k-Memory-Tester (TOOL) various authors (PD);
192k memory (64k RAM + 128k RD) A,E Ramdisk blocks;
(2 blocks each with 4 banks, overall: 8 banks);

- 256k-Memory-Tester (TOOL) various authors (PD);
256k memory (64k RAM + 192k RD) A,C,E or 8,A,E blocks;
(3 blocks each with 4 banks, overall: 12 banks);

- 320k-Memory-Tester (TOOL) various authors (PD);
320k memory (64k RAM + 256k RD) 8,A,C,E or 2,6,A,E blocks;
(4 blocks each with 4 banks, overall: 16 banks);

- 576k-Memory-Tester (TOOL) various authors (PD);
576k memory (64k RAM + 512k RD) (overall: 32 banks);
(8 blocks x 4 banks -or- 4 blocks x 8 banks);

- 1088k-Memory-Tester (TOOL) various authors (PD);
1088k memory (64k RAM + 1024k RD) (overall: 64 banks);
(4 blocks x 16 banks for Mathy van Nisselroy`s RD and maybe others);

(8 blocks x 8 banks for Newell, Peterson, TOMS and compatibles);
(16 blocks x 4 banks should also be possible, but do not exist yet!);

- 2112k-Memory Tester (TOOL) Satantronic`s XRAM 0.18;
2112k memory (64k RAM + 2048k RD) (overall: 128 banks);
(8 blocks x 16 banks -or- 16 blocks x 8 banks);

- 4160k-Memory-Tester (TOOL) ??? (authors unknown);
4160k memory (64k RAM + 4096k RD) (overall: 256 banks);
(16 blocks x 16 banks, means blocks 0-F each with banks 0-F);
(note: with 1 PIA chip the main RAM 4000-7FFF is not available!);

- 8256k-Memory-Tester (TOOL) ??? (authors unknown);
8256k memory (64k RAM + 8192k RD) (overall: 512 banks);
(afaik, this upgrade requires 2 PIA chips or some uncool tricks!);

- 16448k-Memory-Tester (TOOL) ??? (authors unknown);
16448k memory (64k RAM + 16384k RD) (overall: 1024 banks);
(afaik, this upgrade requires 2 PIA chips or some uncool tricks!);

=> Note that 2MB-16MB extra RAM / Ramdisks are very uncommon
in the Atari scene! These upgrades were once sold by ICD and
Newell (maybe a few ones also by FTE) and of course they were
and still are selfmade by some crazy Atarians. It is not clear
if there is any software (games, apps., demos) available, that
supports these mega-upgrades fully. Afaik, only few Atarians
have and use them, mostly users of mailboxes / BBS`es...;

- APC-Archiver 1.0 (TOOL) LBS/APC;
320kbytes minimum memory 26AE = no!, 8ACE = YES!;
(It seems like this program does not work on Ataris which have
more than 320kbytes of RAM, i.e. it crashes on my 576k Atari)

- APC-Packer 1.1 (TOOL) LBS/APC;
320kbytes minimum memory 26AE = no!, 8ACE = YES!;
(It seems like this program does not work on Ataris which have
more than 320kbytes of RAM, i.e. it crashes on my 576k Atari)

- Atari Writer Plus Super Menu Ken Siders;
a) AWP + Super Menu 128k RAM 130XE-Ramdisk;
b) AWP-XE + Super Menu 256k RAM 26AE = ???, 8ACE = ???;

- ATOS/ATari Operating System (TOOL) CTH / Tom Hunt;
64k RAM + 16MB-HDD-Partition all Sparta-DOS Ramdisks;
(the standard system is configured for a 16MB harddisk partition,
however it is possible to change this and use an Atari with a big
floppy drive and/or ramdisk; but this requires quite some work!)

- Audio/Studio Master ANG/Mirage;
minimum 320k RAM 26AE = YES!, 8ACE = ???;
(the program is a part of the 4Bit A/D converter software!)

- Boot-Majster (TOOL) Electron;
128k RAM 130XE-Ramdisk;

- Boss-X - Version 10.x (TOOL) MS-Soft / Mirko Sobe;
128k RAM and more all DOS 2 und MyDOS RD`s;

- Boss-XE - Version 8.x (TOOL) MS-Soft / Mirko Sobe;
128k RAM and more all DOS 2 und MyDOS RD`s;

- CAD-XE (TOOL) (HAPS-PD 0350);
128k RAM 130XE-Ramdisk;

- Castle of Blackthorne (GAME) L.o.D. / Thimo Graef;
128k RAM 130XE-Ramdisk;

- Cavepack (Game) KE-Soft / Kemal Ezcan;
XE-Version = 128k RAM 130XE-Ramdisk;

- Computer Baseball (GAME) Douglas Blackwell
128k RAM 130XE-Ramdisk

- Degas-View-XE (Tool) Mat*Rat / Mathew Ratcliff;
128k RAM 130XE-Ramdisk;

- Diskettenverwaltung 130XE (TOOL) (ABBUC PD 86);
(database 130XE) 128k RAM 130XE-Ramdisk;

- Draw XE (TOOL) (ABBUC PD 387);
128k RAM 130XE-Ramdisk;

- Dream Vision (TOOL) (ABBUC PD 480);
(IFF-Viewer) 256k RAM 26AE = YES!! ; 8ACE = ??? ;

- Filemanager/Filecopiers (TOOLS) various authors (PD);
128k=> 1 floppy is enough Sparta and DOS 2.x RD`s;

- Fraktale & Colorprint (TOOLS) (ABBUC PD 349); P.Woetzel;
(fractals & colorprint) 128k RAM 130XE-Ramdisk;

- Gizmo`s Castle (GAME) Black Panther / M. Kugler
XE-Version = 128k RAM 130XE-Ramdisk;

- Grafik-Zeilen-Editor (TOOL) (HAPS PD 0296);
(graphic-line-editor) 128k RAM 130XE-Ramdisk;

- Hi-Res Designer (TOOL) (HAPS PD 0015);
(gr.8 drawing program) 128k RAM 130XE-Ramdisk;

- Hires-Dump (TOOL) (ABBUC PD 113);
(gr.8 print-program) 128k RAM 130XE-Ramdisk;

- Inertia 4.5 (MODplayer TOOL) MadTeam
a) 128k RAM 130XE-Ramdisk
b) more than 128k RAM 26AE = YES!, 8ACE = YES!;

- Kaiser II (GAME) Phoenix Softcrew / C.Strotmann;
a) 64k RAM Version any 64k XL/XE computer;
b) 128k RAM Version 130XE-Ramdisk;
c) 320k RAM Version 26AE = YES!, 8ACE = YES!;
(this game comes in 3 separate versions; plays good on 64k

computers, but needs less disk-swaps on bigger machines !!)

- Kassettencopy (TOOL) (ABBUC PD 466); J.Gernreich;
(Cass.copy) Copy64 = 128k RAM 130XE-Ramdisk;

- Kemna-Video (TOOL) (ABBUC PD 185);
(intro-creator) 128k RAM 130XE-Ramdisk;

- Koala Slideshow XE (TOOL) Charles Johnson/Analog
128k RAM 130XE-Ramdisk

- Koenigsdiamanten (Game) KE-Soft / Kemal Ezcan;
XE-Version = 128k RAM 130XE-Ramdisk;

- Lightraces (Game) (Power per Post);
XE-Version = 128k RAM 130XE-Ramdisk;

- Macro-Assembler-XE 4.32 (TOOL) (ABBUC PD 297); T.Karwoth;
(older version!) 128k RAM 130XE-Ramdisk;

- Macro-Assembler-XE+ 2.x (TOOL) (ABBUC PD 368); T.Karwoth;
(newer version!) a) 128k RAM 130XE-Ramdisk (MyDOS only!);
b) 128k - 1088k (MyDOS only!) 26AE = YES!! ; 8ACE = YES!! ;
(has a rambank-finder program that can be loaded from Basic or the
menu!; the assembler does not work on a CS ramdisk with refresh bugs!)

- Masher-XE V1.0 ??? (author unknown);
minimum 128k RAM 130XE-Ramdisk;
192k, 256k and max. 320k RAM AE, ACE and max. 8ACE RDs;

- Memdrv10 (RAM-Tester TOOL) Andre 'MacFalkner' Bertram
$D301 all Portbits 16k up to 4 MB (all standard RD`s);
$D600 up to ??? MB (Klaus Peters Megaram 3 Ramdisk)
includes 16k Bankswitching and exotic 32k (Buchholz) Bankswitching

- Menu 130 (TOOL) Les Howarth/Page 6
128k RAM 130XE-Ramdisk

- Midi Mate III Hybrid Arts;
128k RAM 130XE-Ramdisk;

- Minesweeper 1-4 (GAMEs) J.R.Chiko/S.A.S.;
128k RAM (4 game versions) 130XE-Ramdisk

- Mister X (Game) (Power per Post);
128k RAM 130XE-Ramdisk;

- Monitors, Debuggers & more (TOOLS) (HAPS PD 0109);
some programs require 128k RAM 130XE-Ramdisk;

- Multi-DOS 130 (TOOL) Kuchera/Excellent;
128k RAM 130XE-Ramdisk;

- Multi-DOS 320 (TOOL) Kuchera/Excellent;
320k RAM 26AE = ???, 8ACE = ???;

(note that Multi-DOS 130 and 320 are no DOS-Versions, they can
be used as *.CMC players; all the rest is unknown to me...)

- Multi-Tasking-OS (various ABBUC magazines);
128k RAM minimum 130XE-Ramdisk (+ST-mouse);

- MTOS XE (Tool) CTH / Tom Hunt;
128k RAM 130XE-Ramdisk;

- MTOS 256 (Tool) CTH / Tom Hunt;
256k RAM (64k+192k) 26AE = NO!! , 8ACE = YES!!;

- [Der] Neffe (Game) (ABBUC PD 52);
(the Nephew) XE-Version = 128k RAM 130XE-Ramdisk;

- Neo-Tracker (TOOL) EPI/Allegresse;
192k RAM minimum 26AE = ??? , 8ACE = ???;

- [The] Newspaper-Editor (TOOL) (HAPS PD 0294 english!);
XE-Version = 128k RAM 130XE-Ramdisk;

- Oelbaron (Game) ??? (author unknown);
XE-Version = 128k RAM 130XE-Ramdisk;

- Programmverwaltung 130XE (TOOL) (HAPS PD 0434);
(database 130XE) 128k RAM 130XE-Ramdisk;

- Protracker 1.5 (TOOL) MadTeam;
128k RAM minimum 130XE-Ramdisk;

- (various) Ramdisk drivers (TOOLs) various authors (PD);
128k RAM and more XE-RD`s, Axlon-RD`s, etc.;

- Rechnen fuer Kinder (TOOLs) (ABBUC PD 85);
(calculations for children) 128k RAM 130XE-Ramdisk;

- Rund um die Ramdisk (TOOLs) (ABBUC PD 383, HAPS PD 1084);
(RD-testers, etc.) 256k RAM and more various XE-RD`s & Axlon-RD`s;

- Sample-Art-XE Mozart/WSL
a) minimum 128k RAM 130XE-Ramdisk;
b) more than 128k RAM 26AE = ???, 8ACE = ???;
(on my 576k-XL the program has some gr.-bugs and crashes very often!)

- Shrink-XE Peter Fitzsimmons;
min. 128k RAM 130XE-comp.-Ramdisks;

- [The] Small Printery (TOOL) Walter Lojek;
128k RAM or more (up to 1MB) 130XE-Ramdisk (minimum!);

- Snapshot (Tool) ??? (author unknown);
128k RAM 130XE-Ramdisk;

- [The] Sound-Utility (TOOL) CTH / Tom Hunt;
(64k), 128k, 256k, 576k, 1MB 130XE-RD; 8,A,C,E Ramdisks;

- Space Harrier (Game) Sheddy / Chris Hutt;
128k RAM 130XE-Ramdisk;

- Strategy Baseball (Game) (HAPS PD 0302);
128k RAM 130XE-Ramdisk;

- Studio/Audio Master ANG/Mirage
minimum 320k RAM 26AE = YES!, 8ACE = ???;
(the program is a part of the 4Bit A/D converter software!)

- Super-Print-Lab-XE (TOOL) (HAPS PD 0909);
(demo-version) 128k RAM 130XE-Ramdisk;

- System+Memory Tester (TOOLs) various authors (PD);
128k RAM and more XE-RD`s, Axlon-RD`s, etc.;

- T-34 (Game) (ANG / Mirage);
128k RAM 130XE-Ramdisk;

- (various.) Tape-Copiers (TOOLs) various authors (PD);
128k RAM 130XE-Ramdisk;

- Tape-Ramdisk-Drivers (TOOLs) various authors (PD);
128k RAM and more XE-Ramdisks;

- Text-130 (TOOL) B.Russmann;
128k RAM 130XE-Ramdisk;

- Textpro "+" (TOOL) Ronnie Riche;
(e.g. Vers. 4.54+) 128k RAM 130XE-Ramdisk;

- The Code Cruncher (TOOL) Soused Teat / A.Bienias;
128k RAM and more XE-Ramdisks;

- The Cruncher 5.0 (Tool) MSL / Magnus;
128k RAM and more XE-Ramdisks;

- The [Sparta DOS] Wedge (TOOL) Ed Bachman;
128k RAM and more + sep. Antic! XE-RD`s with separate Antic!;

- The Works (Tool) CTH / Tom Hunt;
128k RAM and more 130XE and A,C,E Ramdisks;

- [Die] Wuerttemberger-Disk (TOOLS) (ABBUC PD 361, HAPS PD 1050);
also contains the XE-version of Gizmo`s castle => see Gizmo`s Castle!;

- (various) XE-Sectorcopiers (TOOLs) various authors (PD);
128k RAM and more XE-Ramdisks;

- XE-Utilities (10 XE-TOOLs) (HAPS PD 0031);
128k RAM 130XE-Ramdisk;

- XL-2 (Tool) John K. Picken;
128k RAM and more all Sparta und DOS 2.x RD`s;

- Zargon (german text-adv. GAME) (ABBUC PD 611, HAPS PD 0485);
128k RAM 130XE-Ramdisk;

- [Der] Zeitungsredakteur (ABBUC PD 121, german!);
(newspaper-editor) 128k RAM 130XE-Ramdisk;

B) Demo-Programs:

- 130XE-Artshow (Koala!) (HAPS PD 0013);
128k RAM 130XE-Ramdisk;
(simply exchange the picture viewer for use with 48k or 64k Ataris!)

- 130XE-Autoshow (Oldtimers!) (ABBUC PD 191, HAPS PD 0637);
(130XE carshow) 128k RAM 130XE-Ramdisk;
(simply exchange the picture viewer for use with 48k or 64k Ataris!)

- 130XE-Demo S.A.G. (Netherlands);
128k RAM 130XE-Ramdisk;
(written in TB; change all D8: entries into D1: for use with 48k and
64k Ataris; exchange Turbo-Basic XL with TB 3.2q, TB 400 or Frost
Basic for use with older 48k Ataris or (most versions of) Sparta-DOS)

- 130XE-Impossible-Demo Rudy Haegemann / V.T.B.;
128k RAM 130XE-Ramdisk;

- Amiga-Boink-XE Bob Armour;
128k RAM 130XE-Ramdisk;

- American Natives Fox-1 / R.Verdaasdonk;
256k RAM all DOS 2 und MyDOS RD`s;

- (X-Files) Animation-Demo Mad Team;
128k RAM ($04 banks / $4b frames) 130XE-Ramdisk;
(the real name of this demo is unknown to me; maybe it is also called
X-Files-Demo, like the X-Files (picture) demo by Sphoon, maybe it has
a different name; on all tested XL/XE Ataris this demo has graphic bugs)

- Animkomials meet Boris Valleyo Animkomials+Boris Valleyo;
128k RAM (gr.9+11 pictures!) 130XE-Ramdisk; (has a setup!);

- Base-33 AIDS / AIDZ;
320k RAM (with Setup!) 26AE = YES!! ; 8ACE = YES!! ;
(=> hold down SHIFT upon bootup to get to the Setup-menu!)

- Bill-Pie-Demo ??? (maybe Mad Team?);
a) 128k RAM ($1E frames) 130XE-Ramdisk; RD-block E;
b) 192k RAM ($36 frames) RD-blocks A+E (CS, Rambo, etc.);
b) 320k RAM ($4C frames) RD-blocks 8+A+C+E (TOMS, etc.);
(=> this demo chooses the Ramdisk & Setup automatically! users of
a Compyshop or compatible RD can merely see the 192k version!)

- BMW-Animation MS-Soft / Mirko Sobe;
128k RAM 130XE-Ramdisk;

- CES-XE-Demo XANTH (full version);
128k RAM (580 sectors) 130XE-Ramdisk;

- Cogito-Demo AIDS / AIDZ;
192k RAM 26AE = no?! ; 8ACE = YES!! ;

- Comet-Ani MadTeam;
a) 128k RAM ($36 frames) 130XE-Ramdisk; RD-block E;
b) 192k RAM ($6D frames) RD-blocks A+E (CS, Rambo, etc.);
b) 320k RAM ($96 frames) RD-blocks 8+A+C+E (TOMS, etc.);
(=> this demo chooses the Ramdisk & Setup automatically! users of
a Compyshop RD and compatible can merely see the 192k version!)

- Critical-Sound-Demo Innovative;
128k RAM 130XE-Ramdisk;

- Danielle-(Gr.9-TB-)Ani NBS / Bill Kendrick;
a) 64k RAM (499 sectors) Disk = very slowww!;
b) 128k RAM or Harddisk RD/HD = much faster !!;
(=> use your favourite DOS, Turbo-Basic and a RD/HD driver!)

- Edelweiss-Demo A.R. + C.S.S. + S.V.L.;
320k RAM 26AE = YES!! ; 8ACE = yes!? ;
(with 8ACE-RD`s you can see all demo-parts, however the mainpart,
known as the Edelweiss-Digi-Sample is shorter & sounds strange!)

- Ergo-Bibamus Quasimodos;
128k RAM (with Setup!) 130XE-Ramdisk;
(well, for 130XE and compatible Ramdisks no setup needed!)

- Extract-Slideshow Bit Busters / Replay;
128k RAM 130XE-Ramdisk;

- Glasshead / HTPPD A.R. + C.S.S.;
320k RAM 26AE = YES!! ; 8ACE = yes!? ;
(with 8ACE-RD`s the animation uses only A+E blocks and is shorter!)

- Halle 1994b: The Wormhole Magic Arts;
320k RAM 26AE = YES!! ; 8ACE = NO!! ;
(well, this demo does not work at all on 8ACE-Ramdisks!)

- (Atari) Hardware-Demo A.R. + C.S.S.;
320k RAM 26AE = YES!! ; 8ACE = yes!? ;
(with 8ACE-RD`s the animation uses only A+E blocks and is shorter!)

- Igor Demo MadTeam;
a) 128k (Part 1, Part 2) 130XE-Ramdisk;
b) 192k (Part 3) 26AE = YES!! ; 8ACE = YES!! ;
c) 320k (Parts 1+2+3) 26AE = NO!! ; 8ACE = YES!! ;
(=> the demo normally runs a setup for 320k memory; but there are 2-3
batch files for each Setup; goto DOS and install the one you want or
need with the JOB command: JOB @xxxx.BAT [RETURN], then reboot disk)

- Imperial (Sounddemo) Innovative;
320k RAM 26AE = YES!! ; 8ACE = YES!! ;

- Impossible but Real! MacGyver / AIDS;
256k RAM (with Setup!) 26AE = YES!! ; 8ACE = YES!! ;

(=> press A for 8ACE-RDs, press B for manual setup of other RDs)

- Isolation Demo Masters of Electric City;
128k RAM 130XE-Ramdisk;

- Journey Polynomials
a) 128k RAM ($36 frames) 130XE-Ramdisk;
b) 320k RAM ($96 frames) 26AE = YES!! ; 8ACE = yes!? ;
(=> this demo chooses the Ramdisk & Setup automatically! the demo
has quite some graphic bugs on 8ACE ramdisks, but is viewable!)

- Journey into Sound DGS / Dean Garaghty;
128k RAM 130XE-Ramdisk;

- Khai-Et AIDS / AIDZ;
320k RAM (with Setup!) 26AE = YES!! ; 8ACE = YES!! ;
(=> hold down SHIFT key upon bootup for the Setup-menu)

- Killer-Whales MadTeam
a) 128k RAM ($2E frames) 130XE-Ramdisk; RD-block E;
b) 192k RAM ($54 frames) RD-blocks A+E (CS, Rambo, etc.);
b) 320k RAM ($94 frames) RD-blocks 8+A+C+E (TOMS, etc.);
(=> this demo chooses the Ramdisk & Setup automatically! users of
a Compyshop RD and compatible can merely see the 192k version!)

- Lajf-Demo MadTeam;
128k RAM 130XE-Ramdisk;

- Landscape-XE-Demo Karl Pelzer;
128k RAM 130XE-Ramdisk;

- Megablast-Sounddemo DGS / Dean Garaghty;
128k RAM 130XE-Ramdisk;

- MTV`s-Danielle see: Danielle-Ani.;

- Nascar-Animation MS-Soft / Mirko Sobe;
128k RAM 130XE-Ramdisk;

- Nonjm-Demo TIGHT;
128k RAM 130XE-Ramdisk;

- Numen-Demo Taquart;
320k RAM (with Setup!) 26AE = YES!! ; 8ACE = YES!! ;
(=> the newer/updated version has an auto-setup for 26AE & 8ACE RD`s!)

- Owca-Demo Animkomials;
128k RAM 130XE-Ramdisk;

- Owca-2-Demo Animkomials;
128k RAM 130XE-Ramdisk;

- Parrot-X-MAS-Demo Anthony Ramos;
128k RAM 130XE-Ramdisk;

- Pedrokko-Sounddemos Pedrokko (10 Disks / 20 S.);
128k RAM (some demos) 130XE-Ramdisk;

- P.I.T. - Demo Quasimodos;
320k RAM (with Setup!) 26AE = YES!! ; 8ACE = YES!! ;
(=> a menu appears automatically; setup 15 banks to run the demo!
this demo does not work correct on Ramdisks with refresh-bugs!)

- Raving Vierpz Pentagram;
128k RAM 130XE-Ramdisk;

- Raytracing 320k Elsni/Stephan Elsner;
320k RAM (TB listings!) 26AE = NO!! ; 8ACE = YES!! ;

- Raytracing 1MB Solocoder of A.C.E.;
1088k RAM (K.Peters Megaram 3) works only on K.P.-1MB-RD !!;
(=> Bootdisk with 8 disksides; loading time: approx. 17 minutes!)

- Raytracing Animation Karl Pelzer;
128k RAM 130XE-Ramdisk;

- Revenge of Hacker Rasero Team;
192k RAM (RD-blocks A+E) 26AE = YES!! ; 8ACE = YES!! ;

- Sweet Fantasy TIGHT;
128k RAM 130XE-Ramdisk;

- Sheol Bit Busters;
320k RAM 26AE = NO!! ; 8ACE = YES!! ;
(on 26AE / CS - Ramdisks you will merely receive an error
message like this: sorry, this demo needs 256k of xms RAM)

- Shiny-Bubbles-XE Brian Paul / LACE;
XE-Version = 128k RAM 130XE-Ramdisk;

- Stash-Demo Rasero-Team;
320k RAM (with Setup!) 26AE = YES!! ; 8ACE = YES!! ;
(=> in the first menu press A for 8ACE Ramdisks or press B for
manual setup of other Ramdisks like Compyshop; in the second menu
press A for 8ACE Ramdisks or C for manual input of Rambanks; don`t
press B -Compyshop- here, since this CS setup is faulty/wrong)

- Starwars-Demo A.R. + C.S.S.;
320k RAM (hold down Option-Key!) 26AE = YES!! ; 8ACE = yes!? ;
(the program checks if Basic is disabled via the Option key, thus
an OS with inverted Basic / Option-key function does not work here!;
with 8ACE-RD`s the animation uses only A+E blocks and is shorter!)

- The Asskicker Shadows Computer Group;
128k RAM 130XE-Ramdisk;

- The Turtles-Demo (Animation!) Ultra-Software;
128k RAM 130XE-Ramdisk;
(the file version by John E. requires 128k, maybe this bootdisk also)

- The Wormhole Magic Arts;
320k RAM 26AE = YES!!, 8ACE = NO!!;
(this demo is part of the Halle Project 1994 demo, side B!)

- Timekeep(er) New Generation;
320k RAM ??? 26AE = NO!! ; 8ACE = YES!! ;
(after loading on an 8ACE-RD be patient! the demo requires some time
for depacking - don`t switch off when you see a black screen, wait!)

- Tit-Demo MadTeam;
256k RAM (with Setup!) 26AE = YES!! ; 8ACE = YES!! ;
(=> the Setup appears automatically; accept or change it !)

- Too-Hard-2 Animkomials (Rippers!);
128k RAM 130XE-Ramdisk;

- Too-Hard-3 Animkomials (Rippers!);
192k RAM 26AE = YES!! ; 8ACE = YES ;
(=> the Setup appears automatically; accept or change it!)

- Too-Hard-4 Animkomials (Rippers!);
320k RAM 26AE = YES!!, 8ACE = YES!!;
(=> the Setup appears automatically; accept or change it!)

- Total Daze TIGHT;
128k RAM 130XE-Ramdisk;

- Trabant Demo / HTPPD A.R. + C.S.S.;
320k RAM 26AE = YES!! ; 8ACE = yes!? ;
(with 8ACE-RD`s the animation uses only A+E blocks and is shorter!)

- Trip-6-Demo Shadows Computer Group;
128k RAM 130XE-Ramdisk;

- Ultra Taquart;
128k RAM 130XE-Ramdisk;

- Vengeance Excellent;
128k RAM 130XE-Ramdisk;

- Vent Excellent+Pentagram;
128k RAM 130XE-Ramdisk;

- Video Blitz Helvetica Bold;
128k RAM (+sep. Antic!) 130XE-Ramdisk + sep. Antic!;

- WAF-Demo (Side B) ABBUC regional group W.A.F.;
128k RAM (2 Parts!) 130XE-Ramdisk;
(=> here the Raytracing and Vector part require 128k memory!)

- Worms-Demo Datri;
320k RAM 26AE = yes!? ; 8ACE = YES!! ;
(with 8ACE-RD`s you see the complete+bug-free version; with 26AE
RD`s you see a shorter and very buggy version with many deja-vues!)

- X-Demo Mad Team;
320k RAM 26AE = YES!! ; 8ACE = NO!! ;

- Xyberscape-XE Bill Le Masurier;
128k RAM 130XE-Ramdisk;

- Zero-Demo New Generation;
128k RAM 130XE-Ramdisk;

Notes: - 256k Compyshop-Ramdisks, 256k K.Peters-Megaram 1,2,3
and Mathy`s 1024k RD have/use 26AE Ramdisk blocks;
- afaik all other 192k / 256k Ramdisks have ACE (8CE)
or 8ACE blocks (Newell, Peterson, Buchholz, TOMS, etc.);
- ??? means unknown; TB means Turbo-Basic (XL);
- HTPPD means Hobby-Tronic-Power-Pack-Demo;
- YES!! means the demo works as it should (100% correct);
- yes!? means the demo works but has some bugs or is shorter
(50-80% correct);
- no?! means the demo almost does not work and has many bugs
(10-40% correct);
- NO!! means the demo does not work at all - it refuses to load
or crashes shortly after loading (0% correct);
- sep. Antic means separate Antic access of the Ramdisk;
(only 2 programs seem to exist: Video Blitz & The Wedge);

Thanks and credits go to Russ Gilbert, Bernhard Pahl and Mathy van
Nisselroy for sharing their info with me. Any corrections and/or updates
are welcome... - Andreas Magenheimer

Subject: 8.13) What voice/sound synthesis software is there for the Atari?

This section by Andreas Magenheimer.

- S.A.M. - the Software Automated Mouth by Don't Ask Software (a
software package; you can find it at Don`s / the author's homepage:
http://www.retrobits.net)
- Softsynth (a PD program, that creates sounds and sound effects via
modulation of the tv/monitor speaker; available from the ABBUC library);
- MOD-Sounds (sound-MODulation, allthough I do not know any software to
create such sounds on an A8, some programs to edit (Protracker) and
playback (Inertia, Modplayer, Neotracker, etc.) these sounds do exist);

Subject: 8.14) What programs support stereo and upgraded sound?

This section by Andreas Magenheimer.

There is already a lot of stereo software for the upgraded Atari computers
available, of course most of these programs are limited to certain/special
upgrades and merely perform their stereo effects on these items (with

otherwise upgraded or non-upgraded Ataris, the sounds or programs will only play in mono):

a) software for the various stereo-upgrades:

- stereo with one Pokey (POPS-software): Afaik for this kind of upgrade, there merely exists a patched version of the Pokey player program, I am not sure if there is anything else for it; anyway, refer to Analog Computing, issue 66, november 1988, pages 54 -60;

- stereo with two computers (thus two Pokeys): Afaik for this simple trick there merely exist two programs, they are "Perestroyka" and "Sky Network" by T.Liebich. In order to achieve the stereo effect, you have to boot/load one of these demos on two computers (connected to different TV's or monitors, there is no need to connect the computers to each other!). When done, press 1-5 on the first computer while pressing Shift-1-5 on the second computer. Meaning, if you want to hear the first sound in stereo then press 1 on computer 1 and press Shift-1 on computer 2 simultanously (that`s a little tricky, I know). If you want to hear sound 5 in stereo, then press 5 on computer 1 and Shift-5 on computer 2 simultanously. Tricky at first, but sooner or later you will get the hang of it. Of course you can also connect the two Ataris to a hifi-system, using the sound output of one Atari for the left channel and the sound output of the other Atari for the right channel...

- stereo-sound with Stereo-Blaster Pro (Portronic/AMC): Afaik there was at least one demo disk (early version was single-sided only, later versions were double-sided), that contained some demo-software, namely the simple "Stereo-demos" (by AMC, side 1) and the "Stereoblaster-Demo" (by HU-Soft, side 2 if available). The Stereoblaster demo was written in Turbo-Basic and played back via Compiled-Turbo-Basic, it uses Chaos Music-Composer Sounds (*.CMC) and a few of these provide stereo effects, if equipped with a stereo-blaster-pro and a hifi-system. The simple stereo-demos included some programs written in Atari Basic, for example a (pong-like) bouncing ball and a flying helicopter. Equipped with a stereo-blaster-pro and a hifi-system, one could see the ball bouncing left and right and simultanously hear the sound fx on the left or right channel. The helicopter started at the left side and produced a loud sound on the left channel, when it was flying to the right side, the sound faded on the left channel and got louder on the right channel, until the helicopter disappeared (and the sound completely faded away). There were some more of these simple demos available, but I don`t remember them anymore.

- Stereo with two Pokeys: There already exist dozens of sounds and demos, that support this upgrade, most of these programs were made in Poland, but a few sound-demos were also made in other countries. Anyway, the following programs support stereo via two Pokey chips:

- Alf-Demo by the Unknown Base (Netherlands);
- Alpha-Demo by GMG (Slovakia);
- AMS-Stereo player by ??? (author unknown), USA;

(there are at least two AMS-stereo-players, that let you play
*.AMS sounds in true stereo or at least simulated stereo!);
- ARS-Mori 16k Intro by Tristesse (music shortened and ripped from
Drunk Chessboard by Infinity!), Poland of course;
- Ballada sound by DJ V / BK (Poland);
- Base 33 by AIDS (msx by Greg, Poland);
- Chaos Music Composer version x.x patched by ??? , Poland;
(=> the original version by Janusz Pelc / LK Avalon is only mono,
but there is a patch available, as well as various patched CMC
versions on the internet; thus *.CMC sounds can be generated in
stereo!);
- (many) *.CMC sounds created by one of the many stereo-versions of
Chaos Music Composer;
- Cogito-Demo by AIDS (Poland)
- Do you see the light? sound-demo by Roemer of UNO (Germany);
- Draconus, patched version by ANG and/or Micro Discount (NL/UK)
(the original version by Zeppelin games is only mono!);
- Drunk Chessboard by Infinity (music by X-Ray!), Poland;
- Dynakillers (Game) by GMG, Slovakia;
- First of All (sound) by Raster, Czech Republic;
- Impossible but Real Demo by MacGyver (Poland);
- King of Aggregat by X-Ray / Slight (Poland);
- Megaplayer Versions 1.6 and 2.0 by MacGyver (Poland)
(=> and thus all *.CMC, *.MPT, *.TMC, etc. sounds played with
this sound-player tool can be heard in true or simulated stereo!);
- Multi-Pro-Tracker 2.4 (various versions) by Jaskier/Taquart?
(=> thus *.MPT sounds can be generated in stereo!), Poland;
- (many) *.MPT sounds created by the stereo-version of Multi Protracker;
- Nazebany by DJ V / BK (Poland);
- Overload sound by X-Ray / Slight (Poland);
- Raster Music Tracker 1.x by Raster, Radek Sterba (a PC program
that creates mono/4-channels or stereo/8-channels *.RMT sounds that
can be played back on the A8 or any Atari 800/XL/XE emulator);
- (most) *.RMT sounds created by Raster Music Tracker;
- Stereo-Patch for Pokey Player by ??? (author unknown)
(=> thus all Pokey-Player / *.V sounds can be heard in stereo!);
- Stereo-Patch for Softsynth by Freddy Offenga (Netherlands)
(=> thus Softsynth will create stereo-sounds!);
- Stereo Patch for World of Wonders by Freddy Offenga (Netherlands)
(World of Wonders is a great Softsynth sound-demo!);
- Still Alive (TMC-sound) by Greg, Poland;
- Time sound by X-Ray / Slight (Poland);
- Theta-Music-Composer version 1.x by Greg (Poland)
(=> thus *.TMC sounds can be generated in stereo!);
- (most) *.TMC sounds created by Theta Music Composer;
- Vanity sound by Kuchara / Excellent (Poland) ;
- Worms (320k-Demo) by Datri, Czech Republic;
- Zybex, patched version by ANG and/or Micro Discount (NL/UK)
(the original version by Zeppelin games is only mono!);
- thats all what I found so far... (A.M.)

b) software for other sound enhancements:

- enhanced-sound with Covox: Afaik this upgrade will playback digitised or sampled sound in 8Bit resolution rather than in 4Bit resolution. The following programs support the Covox-Upgrade:
- Inertia 2.9, a MOD-player by MadTeam;
- Inertia 4.5, a MOD player by MadTeam;
- Protracker x.x, a MOD-editor and player by ???;
- NeoTracker 1.x, a MOD+NEO+... player by EPI/Allegresse;
- that's all I have found so far;
note that all programs (except neo-tracker?) will still work with pokey...;

Subject: 8.15) What games support online action via modem?

This section by Andreas Magenheimer.

- Modem Chess, a PD game in Basic by ???
- Modem-Battleships, a PD game in Basic by ???
- Tele-Chess, a PD game in Basic by ???
- probably some more games...

(I have also seen an advert from GCP in Analog or Antic, that listed the following games: The City, Cybertank, Cybership, Bio-War, Lords of Space; I am not sure if they are all available for the Atari, A.M.)

To play these games online, one would not only require an Atari computer, but also a modem, a modem-driver and/or a terminal program (like Kermit, Bobterm, Teleterm, A-Term, Ice-T, BBS Express Pro, etc.). See also the sections 7.8, 10.1 and 10.2 which tell you more about modem/terminal programs and modem hardware for the Atari...

Subject: 8.16) What programs support Atari computer networking?

This section by Andreas Magenheimer.

There are two different hardware add-ons which provide a "computer-network" (two or more Ataris linked together). Thus, there is software that supports either one or the other hardware (namely Gamelink-1 or Gamelink-2). The following software supports the networking hardware:

- Gamelink-1 (by Dataque):
- info-text about GL-1 and where to buy it, by Dataque;
- Tic-Tac-Two by J.Potter/Dataque, a tic-tac-toe clone;
- Modem-Battleships, patched by Rick Detlefsen for Gamelink-1;

- Gamelink-2 / Multilink (by Dataque & Bewesoft):
- info-text about GL-2 and where to buy it, by Dataque;
- info text about Maze of Agdagon demo, by Dataque;
- Maze of Agdagon demo (1 player only) by Dataque;
- documentation for Maze of Agdagon (full version) by Dataque;
- Maze of Agdagon (full version, 2-8 players) by Dataque;

- description of multilink/gamelink-2 hardware and schematics by
Bewesoft (two texts, one in czech and one in english; schematics
presented as an Atari Gr.8 picture for a) easy-2-computer hardware
and b) more complicated 2-8 computer hardware);
- Multi-Dash (2-8 players, XL/XE only) by Bewesoft;
- Multi-Race (2-16 players, XL/XE only) by Bewesoft;
- description of "how to program networking games for multilink
[gamelink-2] hardware" (text available in english and czech, with
lots of source codes and OS adresses/variables/...) by Bewesoft;
- Multi-Worms (2-8 or 2-16? players, XL/XE only) by Bewesoft;
- complete + documented source code for Multi-Worms by Bewesoft;
- "starter-kit" module to use in your own networking-games by Bewesoft
(free use of this module is granted by Bewesoft/Jiri Bernasek);

Subject: 9.1) How can I work with .arc files on my 8-bit Atari?

ARC.EXE for MS-DOS was released by System Enhancement Associates (SEA) around
1985. It will compress and store groups of files as one file, making it
easier and quicker to download programs and support files at once. Because of
the ease of use and availability of this program, it quickly became the
defacto standard for file archives on Intel-based IBM machines. Files
compressed and stored with ARC or a compatible utility are normally given the
filename extender ".arc".

The 8-bit Atari computers have several software utility options that are fully
compatible with ARC.EXE, the most important being:

Super UnArc 2.4 and Super Arc 2.4 - shareware by Bob Puff, released 01/31/89
Available:
http://www.nleaudio.com/css/files/superarc.arc (complete package + docs)

Also, SpartaDOS X includes a fully compatible ARC command for both creating
and extracting .arc files.

Subject: 9.2) What file formats for entire disks/tapes/cartridges are there?

It is now common, especially when working on Windows PCs or Macs, to work with
Atari software as files or "images" containing the data from an entire disk,
data cassette, or cartridge as duplicated from the native media for the Atari.

Here is a list of file formats, arranged by their associated filename
extensions. These are all filename extensions used to name files containing
entire 8-bit Atari floppy disk images, cassette tape images, or cartridge
images.

.DCM -Image format invented by Bob Puff, for his Disk Communicator 3.2
utility.
Used when working with native Atari hardware.
DISKCOMM is at http://www.nleaudio.com/css/files/DISKCOM.ARC
DCM specs at: http://home.planet.nl/~ernest/diskcomm.zip

.ATR -Image format invented by Nick Kennedy, for his SIO2PC project.
Used with most 8-bit Atari emulators running on other computer
platforms. SIO2PC is at http://www.tcainternet.com/wa5bdu/

.XFD -Image format invented by Emulators Inc, for their ST Xformer emulator.
Identical to ATR except without the 16 byte header.
Used with ST Xformer and PC Xformer emulators.
Xformer is at http://www.emulators.com/

.PRO -Image format invented by Steven Tucker, for his APE ProSystem device.
Used with APE, the Atari Peripheral Emulator.
APE and APE ProSystem are at http://www.atarimax.com/

.SCP -SpartaDOS SCOPY image file. SCOPY was a utility by ICD.

.DI -Image format invented by Kolja Koischwitz & Christian Kruger for their
800XL DJ emulator for the Atari ST.

.CAS -Cassette image format invented by Ernest R. Schreurs, for his
Digital Cassette Image system (includes CAS2SIO, WAV2CAS, and CAS2WAV
MS-DOS utilities. See: http://home.planet.nl/~ernest/

See also:
Atari Disk Image FAQ (Steve Tucker)
http://www.atarimax.com/ape/docs/DiskImageFAQ/

One tool for converting among all of these disk image formats is:
Acvt v1.07 by Jindrich Kubec, found at http://jindroush.atari.org

---

Subject: 9.3) How can I copy my copy-protected Atari software?

Russ Gilbert writes:

Almost all commercial software for the A8 is/was copy
protected. For boot disks, this usually involved a large
number of special formatting that couldn't be copied using
ordinary sector copiers. Usually the boot process involved
checking to see if a certain sector error occurred, then
proceeding. If the error did not occur, the disk was a copy
and would not work.

For carts, usually the method of protection was to write to
the cart area of memory and see if the value changed. If the
value changed, the cart program was in RAM, not ROM and
would fail to operate.

For tapes, again a fair number of schemes were used. Some
varied the speed at which the tape loaded. I'm not familiar
with tape protection schemes.

With all software media (cart, tape, disk), there may be
program encryption, which must be decrypted before the
program can run. This to make more difficult disassembly of
the program.

There were/are a number of products to defeat copy protection/allow copying of protected software for the A8. The most common way to defeat copy protection was to disassemble the software and revise sections of code so that the copy protection was defeated. A software with defeated copy protection is called a 'cracked' software. The basic procedure is to understand how cart/tape/disk software initializes, loads and runs. Usually make a file out of the software and 'follow the code', starting with loading of the program, to decryption to the actual running of the program. Today, it is unnecessary to copy original commercial A8 software because it has already been defeated and may be found at a few ftp sites. (Note umich archive has no commercial/non-shareware software.)

Besides 'cracking' software, there were/are hardware devices to copy commercial protected software. The Happy 1050 and the Archiver, and probably other modifications to the 810, or 1050 allowed 'bit image' copying and reproduction of the special formatting that copy protected disks had. Using these archiving disk drives, a copy of the original disk, including all special formatting and the original code is copied, thus making a copy protected copy, not cracked, just like the original.

For carts, copying could involve cracking or again there were/are products to reproduce the cart and simulate a ROM. Or the cart might be copied and burned on the correct type of eprom, to make a plug in cart. 'The Impersonator', the 'Pill' are two cart copy schemes copy the cart to a file, then don't change the code, but use a 'dummy cart' to fool the software into thinking there is a ROM present.

Basic tools for copying, then cracking, carts and disks are a sector editor and disassembler. Carts are usually most easily dumped using a special OS, like Omnimon, to interrupt the cart and dump memory to disk. There are a few pd cart copiers that have the user plug the cart in when the program is running, I don't believe these pd cart copiers are very good or very wise to use.

So, the basic answer to 'how do I make a copy of my copy protected commercial software' is don't bother. Find it on the net.

There is one exception, in that this 'solution' involves a minimum of effort and is relatively safe. I refer to 'Chipmunk' and 'Black Patch' software to make cracked boot disk copy of commercial disks. HOWEVER, even if you use these two commercial archival tools, be sure you write protect your originals, and be careful not to accidentally write to the original disk.

Finally, I'll mention a very modern (I mean 1997) product.
The APE ProSystem, by Steven Tucker, in the registered
version of this shareware allows making disk images called
'Pro' images. APE (Atari Peripheral Emulator) requires a
cable, called the SIO2PC cable, that connects the A8 13 pin
serial port to a serial port on the IBM PC clone. To make
'Pro' images, a special adapter cable is needed, not just
the 'standard' SIO2PC cable. The 'Pro' image can 'capture'
the copy protection of an original commercial disk. The
'Pro' image can then be loaded into an A8 using the APE
registered version software, thus backing up your original
disk software. Note the 'Pro' image will only be of use to
person(s) owning registered APE software and 'Pro' adapter
cable.

Subject: 10.1) What programs can log in to other computers via modem?

Here are some of the more popular PD/freeware/shareware terminal emulator and
related programs available. Use one of these programs for accessing a dial-up
Bulletin Board System (BBS) with your Atari, or for accessing a dial-up "shell
account" with your Internet Service Provider (ISP). Dial-up shell accounts
are no longer widely available here in the 21st century! (There is no
general-purpose PPP capability for the 8-bit Atari that I am aware of.)

ATAR-Z-MODEM 1.2, 5/29/94, shareware by Larry Black
Emulates: n/a
Text: 40 columns in gr.0
File Xfer: ZMODEM download
Autodial: No
Backscroll buffer: No
Capture-to-disk: no
Summary: Intended to be used as an external ZMODEM receive utility in
conjunction with other terminal programs, especially BobTerm
http://www.umich.edu/~archive/atari/8bit/Telecomm/Protocols/atzmod12.arc

BobTerm 1.22, shareware by Bob Puff
(There's also a 1.23 release that's specific to PC XFormer)
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Feature-filled; best for BBSing
Available: http://www.nleaudio.com/css/ (version 1.21)
ftp://ftp.spudster.org/pub/atari/cth/terminal_programs/BOBTM122.ARC (com only)
http://people.a2000.nl/becotel/archive/bobt123.arc (1.23)

FlickerTerm 80 v.0.51, freeware by LonerSoft (Clay Halliwell)
Emulates: VT100, IBM ANSI
Text: 80 column via a special Graphics 0 screen (no hardware req'd)

File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Fastest and most complete VT100 emulation; readability a minus
ftp://ftp.spudster.org/pub/atari/cth/terminal_programs/FLICK051.ARC

Ice-T XE v2.72 (128K XL/XE) or Ice-T 800 v1.1 (48K)
shareware by Itay Chamiel
Emulates: VT100
Text: 80 column via a fast-scrolling graphics 8 screen
File Xfer: X/Y/ZMODEM download
Autodial: Yes (2.72) or No (1.1)
Backscroll buffer: Yes--8 screens (2.72) or One screen (1.1)
Capture-to-disk: Yes--up to 16K (2.72) or No (1.1)
Summary: Outstanding flicker-free high-speed VT100 emulation.Recommended!
Available: http://www.cs.huji.ac.il/~itayc/

Kermit-65 3.7, PD by John R. Dunning
Emulates: VT100
Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)
File Xfer: Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Excellent VT100 emulation; rock-solid Kermit Xfers
filenames: k65v37.arc ; k65doc.arc - docs ; k65src.arc - source

OmniCom by CDY Consulting (David Young)
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Only option combining VT100, XMODEM, Kermit
filename: omnicom.arc

PabQwk 2.0, 1 Feb 1994, shareware by Low-Budget Productions (Pab Sungenis)
Requires: 128K XL/XE
Emulates: n/a
File Xfer: QWK upload/download
Summary: The Professional QWK reader for the Atari 8-bits. (QWK is a
packet format created in the IBM BBS community for reading mail
offline.)
http://people.a2000.nl/becotel/archive/pabqwk20.arc

Term80 1.6 (8.25.95), by CTH Enterprises (Tom Hunt)
Requires: MIO or Black Box
Emulates: ANSI
Text: 80 columns in gr.8
File Xfer: XMODEM receive, YMODEM send/receive

Autodial: Yes
Brackscroll buffer: No
Capture-to-disk: Yes
Summary: Designed for calling IBM ANSI BBSs at the highest possible
speeds supported by the MIO and Black Box (14.4 Kbps)
Available: http://cth.dtdns.net/Featured/term80/term80.html

VT850 B1, shareware by Curtis Laser
Emulates: VT100/VT102 (plus complete VT220 keymap)
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Only option for VT100 emulation on the XEP80; 1200bps top speed
filename: vt850b1.arc

Subject: 10.2) What programs can I use to host a BBS on the Atari?

The 8-bit Atari was particularly popular for hosting a dial-up Bulletin Board System (BBS). Uploading/downloading files, online messaging, even online gaming services can all be hosted on an 8-bit Atari operated as a dial-up BBS.

This section attempts to list all BBS programs for the Atari. Of these, BBS Express! Professional and Carina BBS seem to be programs that stand up well even today.

Contributors to this section include: Winston Smith, Steven Sturza, Chad Hendrickson, Don Fanning, Matt Singer, Pete Davis, Jeff Williams

o AMIS BBS -- The Atari Message Information Service, public domain.
The "granddaddy" of BBS programs for the 8-bit Atari.

The AMIS BBS was written in BASIC by people from the Michigan Atari Computer Enthusiasts. It included designs for a ring-detector. You needed a sector editor and had to allocate message space by hand, hex byte by hex byte.

Several versions of AMIS:
* Standard AMIS
* MACE AMIS - from the Michigan Atari Computer Enthusiasts
* Fast AMIS
* MPP AMIS by Matt Pritchard
* TODAMIS 1.0, for 1030/XM301, 1986, Trent Dudley

o ATABBS -- Rod Roark writes (3/12/03):
This is really straining my memory -- don't recall exactly when I wrote the thing (maybe '80 or '81), but as far as I know ATABBS was the world's first BBS for the Atari 400/800.

I ran it out of my condo in Atlanta on a 48K 400 with an 80K floppy drive and a 300 bps Hayes Smartmodem. The 48K memory

module was a third party add-on, not Atari's.

It was written in Atari BASIC with a few bytes of machine
language thrown in.

o ATKeep -- An Atari 8-bit version of CITADEL BBS, by Brent Barrett
ATKeep is a Citadel-like BBS system for eight-bit Ataris. ATKeep runs under SpartaDOS and requires BASIC XE and 128K of RAM. Originally "MBBBS (Message Base Bulletin Board System) 1.0, March 24th, 1986" MBBBS was changed to Atari Keep, or, ATKeep for short, around version the time version 4.0 was released (June 15, 1986).

ATKeep 7.0 finally took the aide and cosysop commands out of a menu section and put them into extended commands, where they belonged. It also added a SYSOP level command set. Users were no longer "users" "aides" or "cosysops," they had become level "A" (SYSOP) through level "Z" (READ ONLY). The system had become extremely complex. Public, hidden OR password protected PRIVATE rooms. Each room now had its own access level (thus keeping people of lower level from getting in EVEN if they knew the room name). Each room was assigned a RWRT (or Read WRiTe status), which determined who could enter messages in it, and whether or not public or private messages, or both were to be allowed.

Before version 7.0, ATKeep only worked with the Atari 1030 or XM301 modems. ATKeep 7.0 was rewritten to accomodate the 850 or PRC interface allowing use of any Hayes compatible modem.

ATKeep version 7.50 was released (1987), was version 8 released?

o BBCS -- Bulletin Board Construction Set, by Scott Brause/Antic, 1985
A machine language program, developed as the Jersey Atari Computer Group (JACG) BBS system.

BBCS was known for it's great flexibility. The sysop was offered easy customization by the use of menus. Many BBSes before it required that you had to actually change the BASIC code in order to customize your BBS.

Unfortunately, it also suffered from a reputation for stability problems.

o BBS Express! -- 1986, Leith Ledbetter/Orion Micro Systems
Written in compiled Action!. 1030/XM301 and 850 versions.

o BBS Express! Professional ("PRO") --
Originally by Keith Ledbetter/Orion Micro Systems, now still a commercial product of Video 61, http://www.atarisales.com
See also http://cth.dtdns.net/pro/pro1.html

Written in 100% machine language.

Requires XL/XE, SpartaDOS 3.2+, hard drive highly recommended, or at least a large ramdisk. R-Time 8 is fully supported.

o Carina BBS -- a shareware product of Shadow Software/David Hunt.
Carina II was originally developed by Jerry Horanoff/CARINA Software Systems

Requires an XL or XE computer, at least 500K of storage capacity (including ramdisk and drives), and SpartaDOS version 2.3 or greater.
Recommended: 192K ramdisk or greater, and an R-Time cartridge.
Fully supported: An MIO interface and a hard drive.

Pete Davis writes (15 Aug 2002):
Carina was a pretty powerful BBS system. Though it was written in BASIC (with a number of machine language routines), it was expandable and had was able to load new BASIC programs with the BBS running. In fact, it was quite modular and would load different sections of the BBS at runtime. I actually used it when I ran a BBS some time back.

Carina 2.6 is available at:
http://www.umich.edu/~archive/atari/8bit/Telecomm/Bbs/carbbs26.arc

Carina is also at:
http://www.aracnet.com/~atari/ftp/car_bbs.arc (download doesn't work for me)

o Carnival BBS -- essentially AMIS with an overlay to allow for private messages and passwords.

o FoReM BBS -- Friends of Rickey Moose BBS. By Matt Singer.
At the time, there were a lot of BBSs around called things such as "FORUM-80" and "BULLET-80", ergo the name. FoReM BBS was the first truly RBBS-like BBS for the ATARI 8-bit. It was programmed in BASIC and was somewhat crashy. I think that this is the great-grandparent of the FOREM-XE BBSs that survive today.

Matt Singer writes:
FoReM BBS derived from an early AMIS. When multiple message areas were added the name was extended to FoReM 26M. Then, When OSS released BASIC XL the program was rehacked and called FoReM XL... Bill Dorsey wrote most of the Assembler routines (where is he now?).

o FoReM XL BBS -- by Matt Singer.
FoReM BBS updated to take advantage of BASIC XL from OSS.

o FoReM XE BBS -- by Matt Singer
This version of FOREM BBS requires the commercial BASIC XE cartridge in order to run. It is in the public domain and can import and export messages from the Atari PRO! BBS EXPRESS-NET (7-bit text only, control ATASCII graphics are reserved for message data-structure bytes).

o FoReM XE Professional BBS / FoReM XEP BBS -- by Len Spencer
A re-write of FoReM XE BBS, last version was 5.4, Jan 5 1993.
FXEP requires an XL/XE computer with at least 128k of memory, the BASIC XE cartridge from OSS/ICD, SpartaDOS 3.2 (this program will NOT work with any other version), and at least 500K of storage.

FXEP is in the public domain, http://members.aol.com/lenspencer/

o NITE-LITE BBS -- Paul Swanson's BBS with RAM disk.
Paul Swanson was a programmer from the Boston, Massachusetts, USA, area.

"1983: Nite-Lite B.B.S. goes on the air. (Was it running A.M.I.S. ?) It is called "Nite-Lite" because the computer monitor casts an eerie glow about the room. 1984: Paul Swanson writes his own BBS hosting software for the ATARI 6502 8-bit computer. He names it "Nite-Lite". The Nite-Lite BBS hosting software goes on to be the most successful commercial BBS software ever written for the ATARI 6502 8-bit computer. 1989: Nite-Lite BBS puts in a second line. (MichTron boards eventually take the place of all of the ATARI Nite-Lite boards.)" - Winston Smith

This BBS was the first to support a RAMdisk, which Paul Swanson called a "V:" device for "virtual disk". This BBS was written in Atari BASIC and required a joystick hardware "dongle" device. This was notable as being one of the first Atari 8-BIT BBSs that could actually go for a week without having to be rebooted. Pointers to the message base were kept in an Atari "very long string" (for which Atari BASIC is famous). The BBS would only have problems (for the most part) if this string became corrupted.

o OASIS (the commercial version) / OASIS Jr. (the pd version)
Originally by Ralph Walden, then Leo Newman took it over, followed by Glenda Stocks/Z INNOVATORS, then Alf (Jeff Williams).

All machine language. OASIS is very crash-resistant and comes with a "dial out" screen so that the Sysop can use the BBS as a terminal program to call and fetch files without having to bring the BBS down and reload a terminal program. OASIS supports "Door programs" which it refers to as "OASIS PAL modules". An excellent message system, and a complex file system. It consists of "file libraries" with suites of "file types". There is quite a bit of overhead involved in performing a download (which may be a good thing, as it discourages file hogs). OASIS IV performs networking.

Glenda Stocks writes at http://world.std.com/~snet/glenda.htm :
I purchased the source code rights to OASIS and began marketing the BBS software to Atari 8-bit enthusiasts around the world. I felt that I had the superior BBS software because I had programmed in the ability to run external programs, including online games and user surveys. I also had added color prompts for IBM clone users who called Atari boards running my OASIS software. Sometime in 1991...I sold the rights to OASIS to a man in Canada..

Jeff Williams ("Alf") writes: (12/6/02)
OASIS was around prior to either PRO or BBS Express IIRC. I don't know when exactly it showed up, version 3.09 was the first one I remember seeing. What made it nifty was it was very fast, being all assembler, and having some different features that things like Forem & Carina didn't have. Compared to something like Forem MPP at the time, it was kind of amazing.

Ralph Walden sold it to Glenda Stocks, who chopped it up into modules and sold it as ver 4.7. PRO was out by then, and was a much more complete offering imo.
Glenda wrote some modules for 4.7, but it never really went anywhere because the architecture was so cramped with her changes.

Eventually she gave up and sold me the source. I looked it over and realized it was a mess and nothing was going to happen with it. I worked on a version 5

for a while, but never made much progress.

o SMART BBS -- by Marco Benton.
This program is written entirely in BASIC. It expects to be running under a SpartaDOS environment. This BBS program uses a "modem clock string" rather than an R-Time 8 cartridge in order to retrieve the current time. It also comes with an Atari BASIC game door called "Sabotage".

Subject: 10.3) How can I read/write 8-bit Atari disks on an MS-DOS PC?

There are several programs that allow an MS-DOS system to work with an Atari-format 5.25" diskette. Each of these work with the Atari SS/DD 180K format, so you'll need an Atari DOS and disk drive capable of this format.

#1 Choice:
AtariDsk V1.2 (c) 95-12-09 by HiassofT (Matthias Reichl)
http://www.horus.com/~hias/atari/

#2 Choice:
MyUTIL by Mark K Vallevand. Based on Charles Marslett's UTIL.
http://www.umich.edu/~archive/atari/8bit/Diskutils/Transfer/myutil.zip
Includes SpartaDOS disk utility v0.1e to access 180K SpartaDOS disks

Other similar utilities:
ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
www.umich.edu/~archive/atari/8bit/Unverified/Diskutils-redist/atario21.arc
SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks.
http://www.umich.edu/~archive/atari/8bit/Diskutils/Transfer/sr.arc
UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks.
http://www.wordmark.org/

Here's some advice on using the above utilities from Hans Breitenlohner:

There are two technical obstacles to interchanging disks between
DD Atari drives and PC drives.

1. The Atari drive spins slightly slower (288 rpm instead of 300 rpm).
If you format a disk on the Atari, then write sectors on the PC, it is possible that the header of the next physical sector will be overwritten, making that sector unreadable. (The next physical sector is usually the current logical sector+2). The solution to this is to format all disks on the PC.
(Aside: Does anybody know how this problem is handled on the XF551? Is it also slowed down?)
Konrad Kokoszkiewicz answers:
"The XF551 disk drive is not slowed down - these drives are spinning 300 rotations per minute. To prevent troubles with read/write disks formatted and written on normal Atari drives (288 rot/min), the main crystal frequency for the floppy disk controller is 8.333 MHz (not 8 MHz, as in 1050, for example)."

2. If the PC drive is a 1.2M drive there is the additional problem of the
track width.
The following is generally true in the PC world:
- disks written on 360k drives can be read on either drive
- blank disk formatted and written on 1.2M drives can be read on
either kind
- disks written on a 360k drive, and overwritten on a 1.2M drive,
can be read reliably only on a 1.2M drive.
- disks previously formatted on a 360k drive, or formatted as 1.2MB,
and then reformatted on a 1.2M drive to 360k, can be read reliably
only on a 1.2M drive.
(all this assumes you are using DD media, not HD).

Solution: Use a 360k drive if you can. If not, format disks on the
Atari for Atari to PC transfers, format truly blank disks on the PC
for PC to Atari transfers.

Jon D. Melbo sums it up this way:
So a basic rule of thumb when sharing 360KB floppies among 360KB &
1.2MB drives is: Never do any writes with a 1.2MB drive to a disk that
has been previously written to in a 360KB drive....UNLESS... you only
plan on ever using that disk in the 1.2Mb drive from then on out. Of
course a disk can be reformated in a particular drive any time for use
in that drive. As long as you follow that rule, you can utilize the
backwards compatible 360KB modes that most 1.2MB drives offer.

While the above mentioned utilities work with SS/DD 180K Atari-format disks or
SS/DD 180K SpartaDOS disks, the following combination of utilities has been
used successfully to read SS/SD 90K Atari-format disks. So if you only have
standard Atari 810 and/or Atari 1050 drives, you could look into:

AnaDisk -- now a product of New Technoligies Inc. (NTI)
See: http://www.forensics-intl.com/anadisk.html
The current version is "not made available to the general public" (!)
Previously a product of Chuck Guzis @ Sydex, http://www.sydex.com/
Older versions available: http://ch.twi.tudelft.nl/~sidney/atari/
- Reads/Writes "any" 5.25" diskette

DeAna by Nate Monson
Available: http://ch.twi.tudelft.nl/~sidney/atari/
- converts AnaDisk dump files from Atari format

See http://ch.twi.tudelft.nl/~sidney/atari/ for tips on using this
combination of utilities.

Preston Crow writes:
"As best as I can figure it out, if your PC drive happens to read
FM disks (I'm not sure what the criteria for that is), then you
can read single density disks on your PC by dumping the contents
to a file with AnaDisk, and then using Deana.com to convert the
dump file into a usable format.

For enhanced density disks, Anadisk generally only reads the first
portion of each sector, but it demonstrates that it is possible for

a PC drive to read enhanced density disks."

Subject: 10.4) How can I read/write MS-DOS PC disks on my Atari?

Several 3rd-party hardware upgrades add the capability of working with
MS-DOS diskettes to your Atari system:

Happy 1050 upgrade for the Atari 1050
-- read/write 180K 5.25" MS-DOS floppies

CSS XF Single Drive Upgrade for the Atari XF551
-- replace the 5.25" mechanism with a 3.5" mech.
-- read 720K 3.5" MS-DOS disks
see http://www.nleaudio.com/css/products/XFsingdrup.htm

CSS XF Dual Drive Upgrade for the Atari XF551
-- add 3.5" drive without losing the 5.25" drive
-- read 720K 3.5" MS-DOS disks
see http://www.nleaudio.com/css/products/XFdualdrup.htm

CSS Floppy Board, for the CSS Black Box
-- adds support for PC 720K and 1.44MB 3.5" drives to your Atari system
-- adds support for PC 1.2MB and 360K 5.25" drives to your Atari system
-- read/write 5.25" and 3.5" MS-DOS disks in your PC drives with your Atari
see: http://www.nleaudio.com/css/products/floppy.htm

Subject: 10.5) How do I transfer files using a null modem cable?

This section by Russ Gilbert.

Q: How do I connect two computers using a null modem cable?

A: You need a term program and RS 232 ports on both
computers. The RS 232 ports need to be connected
together using a 'null modem cable'.

For up to 4800 baud, no flow control lines need be
connected. Just cross the transmit and receive lines
and join the grounds together. Transmit is pin #2,
receive is pin #3 and ground is pin #7 on the 25 pin
port. 25 pin #2 goes to Atari #4 (XMT to RCV), 25 pin
#3 goes to #3 on Atari (RCV to XMT) and #5 of 850 goes
to #7 of 25 pin (GND to GND).

The right hand pin on the 'long' side of a female 'D'
connector is #1. There are 13 holes on this 'long'
side, 12 holes on the 'short' side. The numbers go
to the left 1 to 13 then #14 is under #1 and left again
so that #25 is under #13.

Most term programs allow a null connection, without a carrier detect. Notably, '850 Express!' does not. I have only used 'Procomm 2.4.3' (the last shareware version of Procomm) on the PC and BobTerm on the Atari, but other term programs may work.

To check your null modem connection, start both PC and Atari term programs, set baud to 2400 or 4800 on both computers. No parity, 8 data bits, 1 stop bit on the PC. Be sure to use the correct COM port on the PC. Go to 'terminal' mode and you should now be able to type on either computer and see it on the other screen. To accomplish a file transfer, use Y-modem probably from BobTerm, rather than X-modem. X-modem will often append bytes to a file transfer, an undesirable event. There is also a very nice Z-modem recieve program for the Atari, called ATAR-Z-MODEM by Larry Black for the Atari.

A convenient way to make a null modem cable, up to about 30 feet long, is to use two female DB25 connectors (Radio Shack) some three or more conductor cable. Using the two DB25 female connectors allows unplugging your modems and plugging in the null modem cable into the two modem cables. This also avoids the confusion of variations in the computer ports. Most computers connect into the modem end via a standard RS232 DB25 connection. With this both ends 25 pin cable, you would cross pins 2 and 3 and connect the #7s together to make a null modem cable.

The SIO port on the Atari cannot be used directly. An 850, P:R: Connection, MIO, Black Box or similar device that provides an RS232 port must be used.

Following are pin assignments for a DB25 pin RS 232 C port.
1. Protective Ground 12. Select Alternate Rate
2. Transmit Data 15. Transmit Clock (sync)
3. Receive Data 17. Receive clock (sync)
4. RTS (Request to Send) 20. Data Terminal Ready
5. CTS (Clear to Send) 22. Ring indicator
6. Data Set Ready 23. Select Alternate Rate
7. Signal Ground 24. Transmit Clock
8. Carrier Detect

For higher speed connections, above 4800 or 9600, you need the flow control lines and Atari term software that has flow control built in. You also need an MIO or Black Box, which uses the PBI (parallel bus). A high speed cable would need not only XMT, RCV, and GND, but also flow control lines. I suggest a commercial null modem from computer store to ensure correct lines. A null modem is a small adapter with the correct lines already

crossed. I don't know how to correctly connect the CTS, RTS, DTR, DSR, CRX lines for a high speed null modem. With a null modem, you just plug it into the 25 pin connectors of the two modem cables you might already have connected to your Atari and PC or Mac. You may need a straight thru 25 pin gender changer also.

Following is in this FAQ elsewhere, but I summarize here: (Figure out or look for pin numbers on the ports.) Note that these are pin assignments, and NOT null modem connections with the XMT, RCV crossed and GND straight thru.

```
Atari 8-bit PC AT 25 PC AT 9 pin
-------------------------------------
1. DTR 20 4*
2. CRX 8 1*
3. XMT 2 3
4. RCV 3 2*
5. GND 7 5
6. DSR 6 6
7. RTS 4 7
8. CTS 5 8
9. No connect? shield RI
22 RI
```

Note: * above indicates the difference between an AT 9 pin and a Atari 8-bit 9 pin cable connector. eg. If you check continuity from pin 3 of 25 pin end and it goes to pin 4 of nine pin end, you have an Atari serial cable. If pin 3 of 25 pin goes to pin 2 of 9 pin end, you have a PC serial cable.
(updated 3/1/99)
(DTE = Data Terminal Equipment ie. your computer.
DCE = Data Communications Equipment ie. your modem.)

Subject: 10.6) How can my Atari use my PC's HD using SIO2PC or Atari810?

SIO2PC
======
From the SIO2PC home page, written by Nick Kennedy:

SIO2PC is a hardware & software package interfacing the 8-bit Atari to PC compatible computers.

The original idea was to have the PC emulate Atari disk drives so Atari programs could be stored on the PC's hard (or floppy) drives. It turned out to be quite successful. About 95% of my work was in the software, but a hardware device to convert logic levels was also necessary. This device is now commonly referred to as an SIO2PC cable.

Features:
- Emulates 1 to 4 Atari disk drives
- Store your Atari files on PC hard or floppy drives
- Boot from the PC, real drive not needed to start-up
- No software or drivers required for the Atari;
no conflicts: use your favorite DOS
- Twice as fast as an Atari 810 drive and more reliable
- Co-exists with real drives in the Atari daisy chain
- Compatible down to the hardware level: use sector copiers, etc.
- Print-Thru captures Atari print-out and routes to PC's printer
- Convert Atari files to PC files and vice versa
- 1050-2-PC version connects PC directly to Atari disk drive

Nick Kennedy
http://www.cswnet.com/~nkennedy/

Another source for building SIO2PC cables is Clarence Dyson's page at
http://www.wolfpup.net/atari/atari.html

Atari810
========
Atari810 1.4d, by Dan Vernon, is a disk drive emulator in the tradition of
SIO2PC, for the Windows NT/2000/XP platform
http://retrobits.net/

Subject: 10.7) How can my Atari use my PC's HD, printer and modem using APE?

David A. Paterson writes:

"Steven J. Tucker took SIO2PC one better and wrote new software.
The Atari Peripheral Emulator (APE for short):

- lets your PC act as high-speed drives.
- It lets you print to your PC printer.
- And it lets you use your PC modem on the 8-bit."

http://www.atarimax.com/

Subject: 10.8) How can I connect my 1050 to my PC with the APE ProSystem?

The APE ProSystem goes beyond APE. The ProSystem has two components:

- The program PROSYS.EXE is used to create the protected and unprotected
disk images which are then used by APE.

- The ProSystem hardware is a cable designed to allow direct connection
of a stock 1050 disk drive directly to a PC's serial port for use by the
PROSYS.EXE software.

http://www.atarimax.com/

Subject: 10.9) What about interoperating with the Apple Macintosh?

Mark L. Simonson keeps a nice set of web pages which he calls "Mac/Atari Fusion: Atari 8-bit Resources for Mac Users." Please visit:

http://www2.bitstream.net/~marksim/atarimac/

Subject: 10.10) Are there 8-bit Atari tools for the Commodore Amiga?

'551conv', freeware by Achim Hartel:
Converts a real Atari-800-disk, .xfd-image or .atr-image into a real Atari-800-disk, .xfd-image, .atr-image or extracts the files of the disk (-image). All 4 formats of the XF551-station supported: Single, Medium, Double, Quad. Version 1.03.

Subject: 11.1) How did Atari get its name?

Graham Thornton types:

This article was published in "I/O - The Magazine of the Atari Home Computer Club" in issue 3 - Summer 1983. The magazine was the official mouthpiece of Atari UK. The article was not attributed to any one person. The words are theirs, not mine.

How Atari Got It's Name

The name Atari actually comes from Japan. And yet the company is most definitely American. Every wondered why? It's an interesting story and one well worth telling.

In 1972 three friends decided to invent and market the first commercially feasible video game. They were Nolan Bushnell, Ted Dabney and Larry Bryan.

To become a partner each man had to submit $100 to the project - a remarkably small sum when you consider the company's success! The next step was to find a name.

Drinking beer and thumbing through the dictionary one day, the three friends came across an interesting entry under "S". The word was Syzygy, or "the straight-line configuration between three celestial bodies". What a perfect name they thought, for three such astronomically talented people!

Now they could get on with the business of inventing games. Their first, Computer Space, was produced and all seemed to be going well.

But then things started to get a little shaky. Larry Bryan decided not to ante up his $100 and pulled out, leaving Bushnell and Dabney to go it alone.

The set up a shop in Santa Clara, California, and incorporated the business. A little later they invented Pong.

Busnell and Dabney applied for the name Syzygy to the Office of the California Secretary of State, which regulates Californian corporations, but were told that they were too late. The name was already taken.

Following unsuccessful attempts to buy the rights to the name from the first Syzygy corporation, which appeared to be inactive, the friends' solicitor pressed them to think up an alternative.

This proved difficult. BD Inc and DB Inc were tested and then rejected in turn: the first bore too close a resemblance to Black & Decker, the second to Dunn and Bradstreet.

Inspiration occurred at last, once again in an informal atmosphere. Bushnell and Dabney were both keen players of Go, a Japanese strategy game, and their best brainstorming always occurred over a good game and a bottle of beer.

This time, they decided to make a list of several Go words to see if one of them would fly as the new corporate name.

First choice was "Sente", which means "the upper hand" - something that greatly appealed. Second and third choices were "Atari", which has a similar meaning to the English word "check", and "Hanne", an acknowledgement of an over-taking move.

Busnell and Dabney submitted the list once again to the Office of the Californian Secretary of State, which approved "Atari". The rest is history.

When the company name changed, Bushnell and Dabney decided to update the logo too. They incorporated the "S" from Syzygy and the "A" from Atari into the new design.

It was not until later, as the company became increasingly successful, that an advertising agency designed the slicker and now famous Atari logo - the "fuji" or stylised "A" design.

Subject: 11.2) What is the History of Atari?

Here is a very condensed history of Atari, centered around their 8-bit computers.

1972
Atari Inc. is formed by Nolan Bushnell, incorporated on Tuesday, June 27. Atari created the first coin-operated arcade video game with the introduction of Pong. The video game industry was launched and has shaped pop culture ever since.

1976
Warner Communications acquires Atari Inc.

1977
Atari launches the Video Computer System (VCS), later known as the 2600, giving

birth to home video game systems.

1978
In December, Atari announces the Atari 400 and 800 personal computers, using the 6502 microprocessor.

1979
Atari files with the USPTO for a patent for a "Data processing system with programmable graphics generator" (the 400/800 computer system) on January 8, 1979. Inventors listed:
Mayer, Steven T. (Auburn, CA);
Miner, Jay G. (Sunnyvale, CA);
Neubauer, Douglas G. (Santa Clara, CA);
Decuir, Joseph C. (Mountain View, CA)

The Atari 400 and Atari 800 Home Computers debut at the Winter Consumer Electronics Show (CES) in early January.

Jerry Jessop writes:
"The first official small shipment of the 400/800 was on August 29th 1979. These were hand built pilot run units to Sears that needed to be in stock by Sept. 1 so they could be placed in the big fall catalog. The units were placed in the Sears warehouse and then immediatly returned to Atari after the "in stock" requirment had been meet.

The first "real" consumer units were shipped in Nov. of 79 and were 400's to Sears followed very shortly by 800's."

All Atari computers are tested at the factory by a master computer called the Atari Sentinel System.

1981
From Atari Connection magazine:
"At the National Computer Conference in Chicago on May 5, 1981 Atari announced that the 8K Atari 400 was being discontinued and that the price on the 16K version was being reduced to $399."

The USPTO grants U.S. Patent 4,296,476 to Atari on October 20, 1981 for the 400/800 computer system. Read the full text of the patent here:
http://makeashorterlink.com/?M2561456

November: 400/800's begin shipping with the new GTIA chip in place of CTIA, increasing the palette of simultaneously displayable colors to 256 and adding 3 new graphics modes. CTIA is totally phased out by the end of the year.

Jerry Jessop adds:
"The very first proto systems did have the GTIA, but it had some problems and was not released in the consumer version until 1981. The GTIA was completed before the CTIA."

1982
The introduction of the 1200XL in late 1982 marks the single largest advance in the 8-bit Atari system.

1983
In 1983 Atari replaced the 1200XL/800/400 line-up with the new 800XL and 600XL.

1984
Warner Communications sells the Consumer Electronics and Home Computer divisions of Atari Inc. to Tramiel Technologies on Monday, July 2.

Atari Corporation is formed by Tramiel Technologies and its products marketed under the Atari brand.

(
Warner initially retains the arcade division of the former Atari Inc., and renames it Atari Games Corporation. Soon thereafter, Atari Games is a private, independent entity, though Warner remains a major investor.

Atari Games inherits Atari copyrights/trademarks/patents for use in the coin-operated arcade video game market.

1987
Atari Games creates the Tengen label for the purpose of marketing games for home game systems (potentially competing directly with Atari Corp.)

1993
Atari Games is purchased by Time Warner.

1994
Time Warner consolidates Atari Games into Time Warner Interactive. Use of both the Atari Games and the Tengen brands are discontinued.

1996
On March 29, 1996 WMS Industries (Williams, Bally and Midway) completes its purchase of Time Warner Interactive. Upon the sale, Time Warner Interactive adopts the Atari Games name and logo, and Atari Games is made a division of Midway Games.

1998
In April of 1998 WMS spins off to shareholders its entire stake of Midway Games, making Midway Games essentially an independent entity. Atari Games remains a division of Midway Games.

1999
Atari Games releases San Francisco Rush 2049. This turns out to be the last coin-operated arcade game sporting the Atari Games name and logo.

January 2000: Atari Games is renamed Midway Games West, and games produced by the group will sport the Midway Games brand.

June 22, 2001: Midway Games announces it is exiting the coin-operated arcade video game market; its game development efforts will now be focused on games for home game platforms. The Midway Games West division lives on, developing games for home systems for Midway Games.

February 7, 2003: Midway Games shuts down their Midway Games West division.
)

1985
The new Atari Corp. delivered on its promise to advance the 8-bit Atari system by replacing the 800XL/600XL with the new 130XE and 65XE in 1985.

According to Atari Explorer magazine, the 130XE was engineered by Jose Valdes.

1987
In a change of marketing strategy, Atari introduced the new XE Game System in 1987. Despite its label, the XEGS is a true 8-bit Atari computer system.

1992
Atari (US) officially dropped all remaining support of their 8-bit computer line on January 1, 1992. (Some 800XE's were still being manufactured in China in 1992.)

1996
On July 31, 1996, in a "reverse merger," Atari Corp. purchased JTS, with the new parent company taking the JTS name while Atari was immediately designated a JTS subsidiary. JTS Corp., with headquarters in San Jose, Calif., was founded in 1994 to design, manufacture and supply enhanced-capacity hard disk drives for the notebook and desktop personal computer markets.

1998
On February 23, 1998, JTS sold its Atari Division to HIACXI Corp., a wholly-owned subsidiary of Hasbro Interactive, Inc., which was a subsidiary of Hasbro, Inc., for $5 million in cash.

(JTS filed for Chapter 11 Bankruptcy Protection on December 11, 1998, and then converted it to Chapter 7 on February 28, 1999)

Hasbro Interactive produced games for several platforms, including PCs running MS-Windows. Some of Hasbro Interactive's games, including several re-makes of classic Atari titles, were marketed under the Atari Interactive name and logo. Atari Interactive was termed "a Hasbro Affiliate."

Games produced by "Atari" under Hasbro ownership included:
Atari Arcade Hits 1 & 2, Breakout, Centipede, Missile Command,
Nerf ArenaBlast, Pong, Q*Bert, The Next Tetris, Atari Greatest Hits

2001
On January 29, 2001 Infogrames Entertainment announced completion of its acquisition of Hasbro Interactive from Hasbro, renaming the subsidiary "Infogrames Interactive." The purchase included the Atari titles and intellectual properties (known at Hasbro as "Atari Interactive").

Between 2001 and 2003 Infogrames placed the Atari brand on some of its "premiere" gaming titles.

2003
Beginning May 7, 2003 Infogrames Entertainment adopts the ATARI brand and registered trademark for all operations, effectively changing the name of the entire company to ATARI.

Additionally, the Company's wholly owned subsidiary, Infogrames Interactive, Inc., which develops many of the game derived from the Hasbro line of board

games, changes its name to Atari Interactive, Inc.

TODAY
New York-based Atari, Inc. develops interactive games for all platforms and is one of the largest third-party publishers of interactive entertainment software in the U.S. The Company's 1,000+ titles include hard-core, genre-defining games such as Driver, Enter the Matrix, Neverwinter Nights, Stuntman, Test Drive, Unreal Tournament 2003, and Unreal Championship; and mass-market and children's games such as Backyard Sports, Nickelodeon's Blue's Clues and Dora the Explorer, Civilization, Dragon Ball Z and RollerCoaster Tycoon. Atari, Inc. is a majority-owned subsidiary of France-based Infogrames Entertainment SA, the largest interactive games publisher in Europe. For more information, visit www.atari.com.

Infogrames Entertainment SA (Euronext: 5257) is the parent company of Atari, Inc., its U.S. subsidiary, and Atari Europe, its European subsidiary. Infogrames Entertainment SA owns 89% of Atari, Inc., which is publicly traded (Nasdaq: ATAR). Infogrames Entertainment SA owns 100% of privately-held Atari Europe. http://corporate.infogrames.com/

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Hi,

possibly a couple of extensions to the already very elaborate and
good FAQ.

> Subject: 8.4) What programs run only on the 400 and 800 models, and why?

> The following are reported as incompatible with models other than the
> original Atari 400/800. Most probably do work on XL/XE's if you use a
> translator to run the original 400/800 OS on your XL/XE. (Alas, most
> translator-versions are limited to disk access, thus booting/loading
> a tape [and especially a cartridge] can be difficult sometimes...A.M.)

/* snip */

There are a couple of reasons why some games don't run on the 800XL/XE
models. I try to order them by "likelyness", of course biased by my
personal observations:

i) The printer buffer of the XL operating system in page 3 is a couple
of bytes shorter. The additional bytes are used for extended Os
variables not available in the 800 series. Most prominent is the $3fa
location, holding a shadow register of GTIA's TRIG3 signal. While a
true joystick trigger line in the 400/800 series, this signal is used
as "cart inserted" signal for XL/XE models. Unfortunately, the Os
compares GTIA trig3 with the shadow register at $3fa in each vertical
blank, running into an endless loop if the register contents don't
match. This causes hangs for games using page 3 either as copy-buffer
for for player missile-graphics. (Hangs by Mrs. PackMan, and
Bakterion! are caused by this, and many others...) This is "fixable"
either by the translator disk, or by a quick hack into the game,
replacing the Os vertical blank or poking TRIG3 frequently into its
shadow. The reason for the Os behaivour might be that Atari wanted to
prevent crashes if the cartridge is inserted or removed while the
machine is running. The 400/800 is powered down when a cart is
inserted, the XL/XE lacks the cover of the older models that triggered
a little switch to interrupt the power line.

ii) Similar to the above, writes to $3f8. This Os equate defines
whether on a warm start, the Basic ROM shall be mapped back in. If
its contents is altered, a program triggering a reset as part of its
initialization will find itself then with 8K less RAM occupied by
a Basic ROM, making it crash. Similarly, writes to the cartridge checksum
$3eb could cause a cold-start on a "reset initialization". This is
fixable by the translator disk.

iii) Some games use a four-joystick setup, or at least initialize
PIA itself. If this happens inadequately, PIA Port B, bit 0 gets changed,
disabling the ROM, and thus crashing the machine. This is not fixable
by the translator since it is a hardware issue.

iv) Direct jumps into the Os ROM, not using the documented vectors in
the $e450 area. Interestingly, this fault is not as common as it may
sound since games hardly ever use the Os. It causes failures of
some "serious applications", most notably "QS-Forth" and applications
compiled by it. This is fixable by the translator disk.

As a side remark, it is interesting to note that no such documented
jump-ins exist for the math-pack ($d800 to $dfff). It is not really
part of the Os, but looks more like a part of the Basic interpreter
that didn't make it into the Os because there was no room left. Thus,
direct jump-ins have to be used here that are documented in the De Re
Atari (for example). Atari never changed them, but it seems likely
that this documentation happened more or less as an accident since the
same source also lists some mathematics-related jump-ins into the
Basic (namely, to compute SIN and COS and related) that are only valid
for the Rev. A Basic. Thus, the math pack might be a couple of
routines that have been originally intended for "private use" of the
Basic ROM, but then have been found "too useful" by many others to
remain "closed". Otherwise, it is hard to explain why the otherwise
pretty cleaned-up Os comes with a construction like this.

So long,
Thomas

It's setting the attract mode on. (-:

How 'bout

POKE 580,1
POKE 65,0
POKE 54018,52 or
POKE 82,0

Anyone?

```
i "think"
```

POKE 65,0 , turns "quiet" load mode....
POKE 82,0 , set the left margin...
POKE 580,1 , makes the computer hangs when you press reset ?????
POKE 54018,52 , makes the computer no being able to list the program
?????

```
Dont remember too well..
But i think at least 2 are right.
```

Hmm,
since it is a turbo-basic program, can it also de-tokenize TB programs
?!? Believe it or not, I have a few protected TB programs (not compiled!
normal TB files!) that I cannot deprotect with the standard Basic
deprotectors... greetings, Andreas.

Hello Marius,

Of course you'll get your five responses, maybe more. Consider this
one a "yes." But be forewarned -- I have seven such BBSs listed in my
telnet programs but only two that I call. A third is part-time. All
the rest have dropped out. It IS a lot of work. But I, for one,
would appreciate seeing another.

Take care.

Alan

Source record: 17512

Hmmm,
Error 170 - filename mismatch, type error, etc. thus the file cannot be
found;
Error 21 - file is not loadable via a) binary load (DOS), b) RUN"D:..."
(Basic)
Error 144 - file or disk is defective; or you found a nice copy
protection...
Error 136- EOF (end of file), file is too short or too long;
Error 12 - you really got me, you really got me !!!

Error 138: Time is out for you and your Atari (floppy drive); your wife
is waiting for you...
Error 139: Atarian driver does not respond or react to his wife...
Error 162: Brain/Head is full (no free sectors left or no dir entries
left)...

greetings, Andreas.

Hmmm,
I also remember an episode from the Simpsons, where Homer goes studying
at the university. when he enters the room of his three comolitones
(computer nerds, of course) they quote some famous "sentences" (aka the
speech samples) from Berzerk - at least in the german version /
synchronization... -Andreas.

308. official rules for the ABBUC contest 2004...

Newsgroup: comp.sys.atari.8bit
Date: 2004-01-16 19:58:05 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <4008424D.C1B292F5@students.uni-mainz.de>
Source record: 17515

Hello folks,
Abbuc has decided to do another software contest 2004. So, here is the chance for every Atari programmer to win some prices (money!). And some good news right at the start: Abbuc does not get the copyright of the contes programs, only the right to release them on the Abbuc magazine - so the authors still keep their rights and may do anything with the program after the contest... Now on with the rules, much more detailed than last year...:

Rules for the ABBUC-Software Contest 2004:

1) General Rules:

- Deadline: 01.August.2004 ! (=> Unconventional);

- Prices: 1. place: 500 Euro + 250 Euro Bonus;
2. place: 250 Euro + 100 Euro Bonus;
3. place: 200 Euro + 75 Euro Bonus;
4. place: 150 Euro + 50 Euro Bonus;
5. place: 100 Euro + 50 Euro Bonus;
6. place: 75 Euro;
7. place: 50 Euro;

- Rights: - ABBUC gets the right of a premiere-release on its magazine!

- Quality Check:- Sorin Pascu (Contest leader!);
- Wolfgang Burger (ABBUC chief!);
- ABBUC members (at the Unconventional & ABBUC hp.);

- Presentation: - author needn't be there/present at the Contest;
- presentation at the Unconventional and ABBUC homepage, decisions and places/prices at ABBUC-JHV 2004;

2) Program Types & Size:

- Program Types: a) Games(s),
b) Application(s)
(also Tools, Utilities, ...)
c) Operating-Systems (DOS, Computer-OS);
=> no Demos !! => no pre-versions, no Alpha/Beta Versions, etc. !!

- Compatibility: - must be minimum XL/XE compatible! (800XL, 800XE, 65XE, 130XE);
=> the support of extra hardware is allowed but this extra hardware mustn't be (!) a requirement to load and/or run the program properly;

- RAM Size: - 0 to 128kbytes ! (min. 64k or max. 128k Ataris!);

- Ramdisk (if any): - if so, must be 130XE compatible, standard
E3,E7,EB,EF banks!;
=> must not use sep. Antic access ! for all XE and XL upgrades!;

- Disk Size: - no minimum or maximum length ! (<=>1 diskside!);

3) Loading & Languages:

- Disk Format: a 5,25" Atari disk or an ATR-image that contains:
- a) Disk-File(s) or b) Boot-Disk(s)
=> no PC-Disks, CD's, Tapes or E-Mails with pure Atari files !!

- Disk Density: a) Single (90k), b) Enhanced (130k);

- Program load: - if Bootdisk: Auto-Boot with/without Basic !;
- if Disk-File: a) DOS 2.x Autorun, b) Gamedos boot;

- Language: a) inside program: english or german;
b) description/doc.: also english or german;

- Pgm. Language: - theoretically any programming language you
know/have/like !
=> but all programs (*) must be compiled or prepared in such a way, that
they will run fine without the used programming language !!
(* with the exception of Atari Basic & Turbo Basic XL listings);

that was it so far. Many rules are self-explanatory, but for some rules
you must keep in mind that Abbuc has 400 members and not all of them do
have DD drives, harddisks, big ramdisks, etc. greetings from ABBUC -
Andreas. Magenheimer.

309. Abbuc-Software-Contest 2004...

in a word, no!. the 800xl doesn't have chroma on the video port, however
it can be added. check out the web for clear video for xl.

Hi gang,

I'm cleaning out some of my collection - here is what I have for sale:

Title Volume Publish Date
Antic Volume 4, Number 5 Sep-85
Antic Volume 4, Number 12 Apr-86
Antic Volume 5, Number 3 Jul-86
Antic Volume 5, Number 4 Aug-86
Antic Volume 4, Number 3 Jul-85

Title Publish Date
Atari Connection Fall 1983

Title Issue # Publish Date
Analog Computing 44 Jul-86

Title Issue # Volume Publish Date
Compute! Issue 46 Volume 6 Number 3 Mar-84
Compute! Issue 47 Volume 6 Number 4 Apr-84
Compute! Issue 49 Volume 6 Number 6 Jun-84
Compute! Issue 50 Volume 6 Number 7 Jul-84
Compute! Issue 52 Volume 6 Number 9 Sep-84
Compute! Issue 53 Volume 6 Number 10 Oct-84
Compute! Issue 54 Volume 6 Number 11 Nov-84
Compute! Issue 55 Volume 6 Number 12 Dec-84
Compute! Issue 56 Volume 7 Number 1 Jan-85
Compute! Issue 57 Volume 7 Number 2 Feb-85
Compute! Issue 58 Volume 7 Number 3 Mar-85
Compute! Issue 59 Volume 7 Number 4 Apr-85
Compute! Issue 61 Volume 7 Number 6 Jun-85
Compute! Issue 62 Volume 7 Number 7 Jul-85

Compute! Issue 64 Volume 7 Number 9 Sep-85
Compute! Issue 63 Volume 7, Number 8 Aug-85
Compute! Issue 65 Volume 7 Number 10 Oct-85
Compute! Issue 66 Volume 7 Number 11 Nov-85
Compute! Issue 67 Volume 7 Number 12 Dec-85
Compute! Issue 68 Volume 8 Number 1 Jan-86
Compute! Issue 69 Volume 8 Number 2 Feb-86
Compute! Issue 70 Volume 8 Number 3 Mar-86
Compute! Issue 71 Volume 8 Number 4 Apr-86
Compute! Issue 72 Volume 8 Number 5 May-86
Compute! Issue 91 Volume 9 Number 12 Dec-87

The magazines range in good (some marking and cover damage) to excellent.

I'd like to sell these all in one shot, so I would say the best offer over the next couple of days would get 'em. If someone were to offer $40 plus shipping it would be a done deal and would make my wife happy. :)

Please email with any questions you might have - thanks!

Set's left margin, get's rid of the 'two spaces' on the left side. I used
this one almost every time I turned the computer on.

What is PEEK(53279) ?
Another number I used quite often and ended up memorizing, even after 10
years of not using it.

315. s-video & 800xl WORKS for me but why?

Newsgroup: comp.sys.atari.8bit
Date: 2004-01-17 01:37:15 UTC
From: "Z.Beeblebrox" <the.z.guy@comcast.net>
Message-ID: <J72dnd7sp4ksDJXdRVn-hA@comcast.com>
Source record: 17522

To sum up: I use this Atari monitor cable
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3067982150&category=3543

and a "Cheesebox" (it has an rca-type video input and an s-video input too)
that outputs to my PCs standard VGA monitor. You can use either one.

I was using just composite video and audio. As 8-bit user "oes" had told
me, "...on that cable for Atari computers, you would use the Red for Video
and the Yellow for Audio."

and it all worked well just as he said....red was video, yellow audio.

So I decided to see if S-VIDEO was clearer. Although I was aware that only
a few 800xls would work without modification. I bought a cable/adapter that
had 2 female RCA jacks at 1 end and an s-video plug on the other end. So -
atari monitor cable to s-video adapter - to cheesebox's svideo port. got it?

Since I already was using atari monitor cable's "red" for composite video &
"yellow" for audio, this left me with the "black" end and "white" end. So I
used those 2 for s-video by process of elimination. AND.....the screen was
clear. But black&white. I figured that was 'cause my 800xl didn't have
both chroma & luminance.

SO What did I try for the heck of it? I plugged in the RED and WHITE cables
to s-video.
Now the screen is in color and looks crisp. WHY?!?!?! I was using red, with
success, by itself into my video-in on the cheesebox. So how does red&white
cables to s-video produce a nice color picture too??? Anyone? Bueller?
Bueller? Fry?

Well, long story short : I don't care! The new s-video configuration looks
clearer than using just the composite to the video port. I can't explain it,
but I don't have to. I just hook it up & enjoy it!!!!

-end transmission-

The egg. It went this way, first there was a salmon who laid an egg in the headwaters of the Monongahela where at the moment of lay an eagle pounced upon the salmon and brought it back to it's nest where the egg was lost among the eaglets and later when it hatched it acquired feathers for it thought it was an eagle but of course it wasn't. As it grew it followed the eaglets over hill and dale which got lost and came to a highway where there were several rabbits about to run across the highway. The eagelsal (salmon with feathers) was to scared to run across the highway and all the rabbits called him chicken. Thus there was the first chicken and of course it was an egg. Yep, the egg came first.

This is written somewhere in the bible.... Ah... someone's bible somewhere.. Or was it on the Rosetta Stone? Writings in the Great Pyramid? Rantings of an old person up at the "home"? It's one of those mysteries we just have to assume is fact.

I don't want to put my name here.

Source record: 17525

Hello all,

I may just end up getting a doubler for my needs at this point, but does anyone know of a trustworthy place to get a Happy board? I tried to order one from Ebay and the person never came through for me. He did, however refund my money, so I am not holding a grudge, although I lost a month of getting my DD disks recovered. I will state that it was not Atarimax. If the other person removes his Happy listings from Ebay, I won't mention his name.

For the short time I have been back into the 8 bit domain, I have received some very helpful emails and positive info from folks, so I just want to make sure nobody gets ripped here, but don't want to bad mouth anyone if they were just having a bad month either.

Thanks,
Don

You might want to check into other drives like Indus or Percom if all you
want to do is DD. Just be sure to get some sort of DOA guarantee, Indus
especially seem to be fragile.

If he is gone it will be a great loss, as he is a great participant and
giver of any and all knowledge about the Atari 8bit He has a great website:
http://www.atariland.com/members/oldatarian/
Ron I still need a few more answers to questions about the ATR8000

324. Review of Sunmark's MultiCart #2

Newsgroup: comp.sys.atari.8bit
Date: 2004-01-17 14:25:07 UTC
From: Daniel Miller <daclmi@mediakingx.com>
Message-ID: <udhi00luupv0980m7kvi9colv5km4e5n07@4ax.com>
Source record: 17531

Multi Cartridge #2 is a recent game compilation cartridge published by Sunmark for the Atari 8bit line of computers. It features 30 classic games, which are selected from a menu screen when you coldboot the computer. After you have selected your game you warmboot with a simple press of the reset switch and it loads that particular game.

There's an excellent selection of games on the cartridge, from Abracadabra to Zaxxon. The games load instantly. I would say this is the most convenient and frustration-free way to enjoy old-school Atari 8bit games. For example the responsiveness is much better than an emulator, and you don't have to use the keyboard.

I think that this cartidge will work on any Atari 8bit computer though 2 of the 30 games are evidently designated 400/800 only. I think I have at least booted each of the 30 games on my 64k 800 and all run beautifully. Now a mini-review of some of the games:

Ms. Pacman was one of the reasons I selected MultiCart #2 instead of one of the other Sunmark multicarts. It is a reasonable rendition of the arcade classic, and faithful in many of the details. The movement is a little bit less than smooth though. My high-score is about 32900 if anyone else wants to try to beat that.

Berzerk. The robots really play for keeps in Atari 8bit Berzerk. I was like "hey take it easy guys, I'm just trying to have some fun here, let me continue for 60 seconds or so, okay?" The bouncing head Evil Otto taunts you in a digitized voice by calling you a chicken, and calls on his robot minion to "stop the intruder" and so on.

Montezuma's Revenge, wow what a great platform game this is, with loads of screens in which your explorer must survive underground Mayan or Aztec hazards and deadly creatures.

Picnic Paranoia was a game that I had heard of but never tried. Very neat game concept with good graphics and interesting, unique play. Armed with a flyswatter you try to stop bugs from stealing your picnic items.

Matterhorn is on here, but it seems very difficult and not so much fun. Maybe I will try it again later. Among the other games are a solid version of Zaxxon as I said, as well as Moogles, Castle Hassle, and Slime.

In summary this is a really nifty cartridge with loads of 8bit entertainment presented in an ideal way. Check out www.sumark.com if you would like to take a look yourself.

From: "Z.Beeblebrox" <the.z.guy@comcast.net>
Message-ID: <pZCdnRHsKqwEx5Td4p2dnA@comcast.com>
Source record: 17533

Rule #1
No cheating and going and doing this in BASIC! You have to know the answer just by reading this.....

Here's the quiz:

Tell me if I will have any problems typing in then running the small BASIC atari program on my 800XL :

```
10 DIM PENNY$(5),NICKEL$(5),DIME$(5),QUARTER$(5)
20 PENNY$="TEST1"
30 NICKEL$="TEST2"
40 DIME$="TEST3"
50 QUARTER$="TEST4"
60 PRINT "THIS IS A TEST..."
70 PRINT PENNY$,NICKEL$,DIME$,QUARTER$
```

That's all folks!

If you think it will work, just say so! If you think it won't, please tell me why.

Don't forget RULE #1

You can also go to www.atarimax.com and buy one of the flash carts from Steve Tucker and make your own custom multicarts which have a built-in menuing system, etc. I own one and it is excellent.

> big but what do you think? Thrift shops? Second-hand computer stores
> and the like?

If you can make it up to Ventura, CA there's a video game store on Main St. The guy who runs the store can be weird to deal with but he does have some Atari stuff (mostly 5200; but with some 8bit cartridges). Plus there's several thrift shops on the same street.

The place is called Treasure Island and it's store front is painted a bright yellow. Here's their contact info:

Treasure Island
242 East Main Street, Ventura, CA 93001
(805) 641-0677

Suggest give a call to ensure they will be open. He sometimes closes the store to go to lunch or something. He can be pricy on some things and cheap on others.

Also, some other places to maybe check (probably will not have Atari 8bit stuff though):

Video Game Liquidators
1045 North Kings Road, #307, Los Angeles, CA 90069
(323) 654-2999

Game Liquidator
117 Iowa Avenue, Los Angeles, CA 90025
(310) 826-4660
lynxgames@aol.com

And if you manage to get down into the South Bay (Silicon Valley) you can always stop by Weird Stuff (www.weirdstuff.com). They're located near the old 390 Carribean Ave wherehouse that was Atari's last wherehouse before they merged with JTS. Weird Stuff is just a neat place to look through. Saw a prototype of a SC1224 there once.

Hope your trip goes well and you find some interesting stuff!

Regards,
Glenn

I believe that it wont work because DIMe is a reserved word.
PENny might be a reserved word also NOT sure.
Put a LET in front of your DIME$ at line 40 and this will probably work.

Simple solution:

40 LET DIME$="TEST3"

This stops the error. The LET command is so little used that it is
often forgotton about.

Greets.

Tired of the same 30 games to play all the time try the new Flash Carts at www.atarimax.com and program your most favorite games with built in -OSB software switch. Cart comes in two flavors (i.e.) 1Mb=128K and 8Mb=1024K some programming required but not necessary because there are a lot of preprogrammed installs. SIO2PC cable required for the 8Mb Cart.

334. Dutch Atari day !!!

Newsgroup: comp.sys.atari.8bit
Date: 2004-01-18 00:41:15 UTC
From: "Ernest R. Schreurs" <ernest@wxs.nl>
Message-ID: <j5hj001n44rdfd2j4i25jdqppc1uihhs9a@4ax.com>
Source record: 17541

On sunday the 8th of february 2004, the second edition of the Dutch
Atari day will be organized again in Dordrecht, The Netherlands.
The location is the Titus Brandsma-Stedelijk Dalton Lyceum.
Kapteynweg 3
3318 EC Dordrecht
The Netherlands
Participants can start building their exhibit from 10:00 am. The
event will be open to visitors from 11:00 am until 16:30. Admission
is free as far as I know. It will be organized by Jos Vlietstra, just
like last year. I can tell you that last time, we all had a good
time, so we hope that this year a lot more visitors will join the fun.
Just like last year, there will be a pile-of-giving-away-Atari-stuff !
It would be nice if everyone would bring Atari software and hardware
(working or not) that they no longer need. It will be put on a pile
where everyone can take something of their interest at the end of the
event. It might just be something your fellow Atarian has been
looking for. The event will be held in a gymnasium this year, so we
have plenty of space. Exhibitors should make sure their equipment is
properly insulated electrically. If you wish to participate contact
Jos Vlietstra by E-mail. You can see his E-mail address on this page:
http://www.geocities.com/titusbrandsmacollege/jos
Everyone should bring their own sandwiches and drinks, since there is
no place to buy these close by.

Directions:
By train: go to the station Dordrecht Zuid.
Walk on the left side of the S. van Gijnweg towards the Sterrenburg
district. After 5 minutes, you can see the back of the school. Turn
left walking on the pink Steve Biko bicycle path and follow the green
fence until you reach a gate after about five minutes.
By car: from Rotterdam take the left tube of the Drechttunnel.
Then take exit Papendrecht immediately after the tunnel. At the
traffic lights go straight for a short while, then take a right turn
onto the Laan der Verenigde Naties. At the next traffic lights go
straight on, passing the Shell pump, then take a right turn at the
next traffic light. Follow the road straight on, passing the traffic
lights, take the railroad tunnel then make sure to be in the left
lane.
Take a left onto the kapteynweg and take a left again and park.
Take the pink bicycle path again and find the gate as above.
If coming from the south, follow direction Dordrecht, take the exit
Centrum, take a right onto the Laan der Verenigde Naties and follow
the directions above.

Attention: The front of the school will be closed! Do not be alarmed,
the entrance to this event is on the back.
See you all there!

Hi Jerry

I've got one here I picked up at active surplus years ago and never used it. I could send it off to you for $5 plus postage if you still havent found another one. Lemme know by email if your still interested.

"Me, too!" :) (old joke)

Yes, count me in as well. I've been away from the scene (Atari 8 and
the net) but I'm back, alive and kicking. Set up my old 800xl about 2
months ago and everyone "took over". So I set up the old PC to lure
them from the Atari. It worked, except for my wife who seems to
prefer the Atari. She likes to play "Poker Squares" and
"Abracadabra". But I digress... Count me in.

338. Looking for a copy of "MicroDungeon" (modified)

Newsgroup: comp.sys.atari.8bit
Date: 2004-01-18 10:10:21 UTC
From: atarian999@yahoo.com
Message-ID: <b787617a.0401180210.7421b0c8@posting.google.com>
Source record: 17545

I am look for a modified copy of MicroDungeon, an old type-in program from either Antic or ANALOG. The specific file was a modified version that I did that was included in a N.W.P.A.C. disk-of-the-month. I know someone out there was a member of N.W.P.A.C. or a club that received a copy in the disk exchange program. My copy(ies) have all suffered bit-rot and I just don't have the time to do the mods again (nor do I think I can remember just what I did). :)

It was my wife's favorite game and when I loaded up the original file from a download, she didn't like it. All the bells and whistles and speed that I added were, of course, not there.

Thanks in advance!

John Collins

>
> How to fix this?

While I don't know a fix, I think I know the problem. At addresses
18/19/20 (dec), the Atari maintains a 24-bit counter. The period of this
thing (assuming you are in NTSC country) is 2^24/60/86400 == 3.23 days.

It seems that the program you refer to has trouble correctly detecting
wrap-around in this counter. This doesn't help you much (unless you want
to dig in the code), but at least you now know what is (probably) going
awry.

Best regards,

Sidney

340. A Hello all and an apology...

I've been absent from in here for a few months, let's just say life
has not been wonderful at times but things seem a little better now.

Not really kept up on stuff atari wise as of late but hoping to
convince Tomek to upgrade WinPlus to the new sources :-)

An apology to those that wrote to me, I wasn't deliberately ignoring
you, like I said, things were rather bad for a while and the last
thing I was doing was thinking of the computer.

Anyways...Hope all is well in here :-)

Even though I had previously collected a selection of adapters to do the trick
of getting from the RCA ends of a standard Atari monitor cable to an s-video
connector, I recently bought myself one of these from More Than Games:

http://www.a8maestro.com/sites/mtgcat/prodhtml/a8avbob.htm

A truly slick device. I highly recommend!

I believe he said that when the IBM PC came out in 1981, though if
someone knows for sure, then do tell.

> Windows 95 requires at least 8MB of RAM -- Bill Gates 1996
> Nobody will ever need Windows 95 -- Logical conclusion
> Intrinsic

Personally, I thought that 8mb was a lot of memory back in 1995, but
when I found out those 486 could be expanded to 52Mb I just laughed.

Do they pay this !@#$ to say that rubbish, I mean if someone told him to
prove that no-one needs more than 640Kb he would be having a hard time
producing the rubbish if they just left it at 640Kb.

Instead it's 1Gb later with 1xx's of Ghz! Time to get the IRS onto Mr.
Gates for losing the bet, or was those comments valid for just 1 year!
;-)

Cheers,
Ross. :-)

He probably never said it at all. He denies saying it, and I don't
believe anyone has ever come up with an actual cite of when and where
was supposed to have said it.

I don't wish to be rude, or funny, but unless u know someone that is willing to sell you a happy 1050 for silly money, you'd be better of with Lazer/USD 1050 board (very in/famous happy clone-UK) or the renamed version Hyperdrive/USD (Lazer under a different name), there was also a mainland european attempt at the happy clone (I think it was made in Germany by Klaus Peters Elektronik) there were 2 versions 1 was called speedy 1050, the other was called turbo or superspeedy 1050 (I think one of the later versions came with 180k or was it 128k on board ram- for better speed copying, in addition the German version was just a tiny bit faster on the SIO rate

I was told there was also a xf551 version of the speedy/superspeedy

Below are extra items I have available for the Atari 8-bit line of computers as well as some for the 2600/7800. All items very reasonably priced (most $2-5) E-mail me at lener@vt.edu to let me know what you are interested in. (US addresses only please) I'll send you more details on condition, contents, etc. and will verify that the software is working correctly. Note - I'm also posting a list of my extra Atari ST items on comp.sys.atari.st Thanks for looking.

Atari 8-bit cartridge games
Airball (boxed)
Barnyard Blaster (boxed)
Blue Max
Bug Hunt
E.T. Phone Home
Fight Night (manual only)
Flight Simulator (manual only)
Hardball
Missile Command (cartridge only)
One-on-One
Pac-Man (cartridge only)
Space Invaders (cartridge only)
Star Raiders (cartridge only)
Time Bound (cartridge only)

Atari Home Computer 6-game Cartridge Case (gray)
Blaster Auto Fire Module (says it works with 2600 & 400/800 on box)

Atari 2600
Canyon Bomber
Donkey Kong
Football
Frogger
Home Run
Maze Craze
Ms. Pac Man
Pitfall
Super Challenge Football
Super Football
Thrust (2000 release)
Video Olympics
plus various other manuals - ask if you have one you need

Atari 7800
Choplifter
Fight Night

Food Fight
Galaga
Hat Trick (boxed)
Hat Trick
Karateka
Mario Bros
One-on-One
Pole Position II
Scrapyard Dog
Super Huey
Touch Down Football
Winter Games

I'm no electronics genius but I would think that if the Indus requires 11.5v
and a 9v 1050 PS is plugged into it, then I doubt it would cause any damage
to the Indus... why would it? It may overload the PS but supplying less
current to a peripheral should not fry it. But if you were plugging an Indus
PS (11.5v) into a 1050 (9v) then I can see how the 1050 could get damaged.
Also, weren't some Indus GT Power Supplies actually 9.3 V? That would be
closer match to a 9v 1050 than the 11.5v is.

And arbitrary changes in the Subject of a reply, breaking thread
continuity, are even more annoying... :)

I have most (if not all) the Antic stuff... what month was it?

They are on the CDs that Aaron sent to me. Perhaps you would like to
purchase a copy of the CDs instead? If not, just tell me the month and I'll
look for it.

The CDs are $10 and they contain just about everything that was on Aaron's
website and more... the games, the utilities, and even the magazine discs.

Payable thru paypal to this email address...

I, for one, believe that websites offer everything that BBS could and more.
I am not trying to rain on anyone's parade, but saying that BBS is outdated
and unnecessary. I believe a well written website would be better.

What do you think of it so far? The game is well built and quite enjoyable, a good credit to a good programmer. I have quit playing however because of the environment. Seems like everyone is always fighting and the Administration aren't better than a couple of juveniles, making the situation no better.

Also, the game lacks a "great quest". Such as "quest of the avatar" which took great effort and involved building up smaller quests (such as meditation at the shrines and finding certain items) in order to solve the great quest (abyss and avatarhood).

yes, I believe you are correct. Notice since the web became popular
bbs's died off. I think that proves we are correct. I think a web
server can do quite a bit more than any bbs program actually. Look at
Vbulletin, which is the internet's most popular online discussion
software it definetly surpasses any bbs progs message base.

Well that's fair enough too, with all the rumors floating around &
stuff been said, it's quite an easy target to say that Bill Gates said
this.

Cheers,
Ross.

If i remember well it was someone at IBM who said that. Bill Gates was not
involved at hardware development at that time.

What I would like to see is a genuine dial up 300 baud BBS for 8bits. There is still a few around for commodore and others. It gives the genuine retro feel plus it makes your modem useful again. And because I use roadrunner, my girlfriend can hang on the internet while I dialup with my atari.

I think it was actually 1MB Bill said. Also, don't remember exact
date, but it was definately in the early days of the PC when only DOS
(no OS/2 or Windows, or even Deskview) were around. In some ways, the
statement, applied ot the 8088 and 8086 of the time was mostly true.
Once the 80286 (and certainly the 80386) came out that line of
thinking quickly becomes outdated.

It took a LONG time for the PC to catch the Atari or C64 in terms of
sound and graphics though. Who nneds sound and graphics for a
business machine after all right. Huh.

```
It can be used actually.

10 DIM A$(10),B$(10),DIME$(10)
20 A$="YES"
30 B$="IT"

This line will give you trouble...
40 DIME$="WORKS"

but, if you use this line instead it's fine...
40 LET DIME$="WORKS"

50 PRINT A$
60 PRINT B$
70 PRINT DIME$
80 END

Prove it by running it and you get this as output:

YES
IT
WORKS

Well, if that 9V is actually 9VAC, then that means RMS. This means
that actual voltages can swing will in excess of 9V, not to mention
the polarity switching. This could potentially damage circuitry
designed for 11.5VDC either via incorrect polarity being applied or
exceeding a voltage max threshold. Granted, if the circuit is
robustly protected via diodes or whatever means, and has liberal
tolerances for applied voltage, then no harm would likely come.

Please note, I am not speaking to specific equipment because I don't
remember if the Atari drives ar 9VAC or DC (I think AC though, or is
that the Atari 800??) and I certainly do not know the make up of the
Indus.

I'd certainly like to see more telnettable 8-bit BBS's. I only know of two right now: Closer To Home and my own Boot Factory 2k+. I would certainly call another telnettable BBS regularly.

Running the program breaks the rule #1 of the contest. I tried to answer
based on my (limited) memory of Atari Basic.

374. Re: Indus Power Supply

Newsgroup: comp.sys.atari.8bit
Date: 2004-01-20 05:06:54 UTC
From: Paul Alhart <paulalhart@hotmail.com>
Message-ID: <OH2Pb.30094$ko5.6737@nwrddc01.gnilink.net>
Source record: 17431

The Indus requires DC, the 1050 uses AC. Plug an Indus supply into a 1050
and in will usually blow the rectifier diodes in the 1050. Plug an Atari
supply into an Indus and it will blow the fuse in the supply. I can damage
the mother board as well.

Hi, I'm Ben Smith, proprietor of Bravo Sierra Computers! I'm an Atari Dealer/Reseller who occupies a unique niche in the Atari World! Most Atari Dealers stick to just selling NEW, I also sell Used/2nd Hand Atari Goods! So not only do I sell NEW Atari Goods at a competitive price, I also sell used Atari Goods you may not be able to find anymore at Swap Meets, Thrift Stores or even Auctions Sites! And I sell for less! And unlike those who will remain anonymous! I test Goods before I sell them. So not only can I sell you some Great New stuff! But I can sell you hard to find 2nd Hand Goods, partly because I'm the guy most people come to when they want to give their Ataris a New Home! I'm saving Orphaned Atari's from Oblivion! Goto http://BensCatalogs.Atari.org or Call (503)256-9974! I'm not asking a lot, I'm just trying to make a living and I'd like to earn your Business!

http://www.aracnet.com/~atari/shipping.htm How I can save you Money!
http://www.aracnet.com/~atari/whybuyben.htm Ben's References!

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. Customers love the speedy service! I have lots of Atari SoftWare & Books. Which I can send by Media Mail Rate!

Please Direct all Replies Through E-Mail to: BenSells@Atari.org or Atari@aracnet.com. If you can't reach me, see my info at the Bottom!

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/ Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at http://BenSells.Atari.org Catalogs can be attached to,Requested by & Received Through E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

Yeah, it's a lot of fun, but it wears thin quickly with all the
stupidity and generally juvenile nature of the community. I agree
with your point about the admins. A lot of polish is missing
(probably still coming, to be fair). For example, what is the point
of having towns that you can't enter? What about shrines that do
nothing? If there is no town map, or function associated with
something, just don't put it in until it's ready. Many of the
dungeons and quests seem half finished and utlimately pointless. The
recent change in "toughness" of the monsters has unbalanced the
gameplay. Who wants to kill slimes for about seven hours of real time
to become tough enough to tackle an orc?

Anyway, not to be too negative.... Fantastic potential, and some good
fun for awhile.

I've been pondering for a while now about that BEEP BEEP you hear when ever an emergency broadcast comes on the television or radio. Obviously it's a form of radio modem, it sounds remarkably similar to the 600 baud Atari tape format. Has anyone ever actually 'read' the beeps or know what they are aimed at?
Just curious,
Mo

That's what a single dimension array is. One dimension still
qualifies as an array. At least in the world of computer programming.

Hi Mo. Not sure about much of it really, but the data nature of the sound seems on the right track. I have a scanner and some other radio units which have a "weather alert" function. This allows them to monitor wx channel(s) and cut over to it in the event of an advisory notice. I cannot help but believe that the signal of which you speak is probably responsible for communicating an "alert" datum of some sort. Mere monitoring for the presence of a transmission wont work because those wx stations are always transmitting routine information via vox.

This was an email I received from the person that created the game. It answers most of your questions, so I thought I would post it for you all to read. If you have any further questions, his email is at the bottom.

===
jhc> course they're not acting like idiots, which 99% of the time they do).
jhc> Kodiak sounds familiar, but I'm not pointing fingers. I think you are
jhc> certainly of experience, age, and maturity to govern your game as you think
jhc> best, for the better enjoyment of all... I only wanted to make a suggestion.

I don't always set the best example. It's ppl like you I'm trying to attract to play, and the irony (or whatever) is that it's the stupid teenagers that set me off and it's the mature players that end up leaving. Actually, I've probably been pretty well behaved the last couple of months :) As for the GMs: I'm not always pleased with what some of them get up to. With what happened when yr wife was on, that just sux - that was when there was a bug where the monsters AI just switched off and they wouldnt fight back: I think certain players were trying to do me a favour by keeping ppl herded in town and away from the mobs.

jhc> In all, I would say that I probably added about 20 new players to your game
jhc> through my postings on newsgroups.

well that's allright: i'll have a look at this group (comp.sys.atari.8bit) later

jhc> I also re-suggest a great and ultimate quest, one that can only
jhc> be solved (perhaps) with a certain number of players at certain levels, with
jhc> certain items that can only be obtained through smaller quests, obtaining
jhc> clues through talking to others and solving the quests. Sort of a major and
jhc> difficult goal to obtain in the game (like quest of the avatar), since the
jhc> main goal of the game so far only appears to be to gain levels.

A large quest is hard for a multiplayer game. I'm thinking about it tho. U know you cant have world changing events, eg finishing your quest causes some volcano to erupt and covers nordhaus in ash and buries it: what about all the other players who haven't done the quest? THo, a quest for the avatar like thing would work - its a good

way to get the shrines involved. BTW, did u ever play PD? There's a
large quest for every player to do on that that isn't game breaking,
tho it's kinda lame.

Thx for yer mail. Do come back in a couple of months. I never expect
anyone to stay more than a week or so - the game's so shallow :P I
only do it cause I like making the engine and showing off what I made.
Incidentally, I re did a Briggs-Meyers test yesterday and turned up as
an INTP (an architect) and the description of the INTP fits perfectly
with me and EUO: obsessive contstructor, emotional, pedantic, hates
incompetence, makes stuff for makings sake but likes showing off what
he made. heh, last time I did a briggs-meyers about 3 yrs ago I showed
up as a INTJ. I don't know why I'm telling you this !

cya then - thx again

Ah yes, I reread the FAQ and indeed the 1050 uses a 9v AC as opposed to the DC ps of the Indus. By the way, are AC power supplies common for older computer stuff? Seems to me that DC is more common... at least that's what I thought. :)

O.K., the Portland Oregonian newspaper beat me to the punch in writing up
a story on the December 30, Portland, Oregon, Micro-Palooza C= Party. The
story is very complimentary. Though the writer mentions Jeri Ellsworth,
he doesn't mention the CommodoreOnes/C-Ones sitting at the front table.

Hi,

> I think DC is more common nowadays..
> Anyways you can connect a DC power supply on an AC input. (most , if not
> all, of the systems, convert ac -> dc inside)

Sorry, but that's not recommendable for at least two reasons. Reason #1
is that pure DC input puts more load on the diodes in "forwards" direction
than on the ones on backward direction, and thus might blow them. Reason #2
is that voltage-doubling circuits don't work on DC supplies. A very good
example is the 1050 drive: It requires 9V AC, and generates from this 9V
AC interally 5V DC (simple) but with a voltage-doubler, 12V DC (for the motor).
This won't work on DC supplies.

So long,
Thomas

402. Floating Point Routines in Action!

Newsgroup: comp.sys.atari.8bit
Date: 2004-01-21 16:24:54 UTC
From: jharmon@us.net
Message-ID: <9a8ae930.0401210824.7d020c9@posting.google.com>
Source record: 17459

I've decided to try to create some basic floating point wrapper functions for Action! These functions will encapsulate the floating point routines in the OS ROM. However, probably due to my inexperience with Action!, I can't seem to get this sample to work correctly. This example is supposed to take 2 ATASCII representations of floating point numbers, use the built in ATASCII to FP function to convert to a native format, multiply the numbers together, and convert result to ATASCII, and copy the result to a string as the result.

I don't know if the problem is something like string termination, but if anyone knows why this code doesn't work, I'd love to know what I'm doing wrong.

Thanks.

Jason Harmon

Thanks for that. It is informative. Perhaps the game will evolve
more depth over time. Perhaps the community surrounding it will
mature as well.

It did give me some good fun for awhile though.

Thanks, got it.. much appreciate your time. I actually have that file dated 6/6/2000 but it doesn't work for me. I tried it on AtariWin and also through Ape for Windows hooked up to my 800xl both with and without Basic enabled... just loads for a bit, screen turns dark grey and it locks up. :(

Thanks a lot though.
Steve

Hi, I'm Ben Smith, proprietor of Bravo Sierra Computers! I'm an Atari Dealer/Reseller who occupies a unique niche in the Atari World! Most Atari Dealers stick to just selling NEW, I also sell Used/2nd Hand Atari Goods! So not only do I sell NEW Atari Goods at a competitive price, I also sell used Atari Goods you may not be able to find anymore at Swap Meets, Thrift Stores or even Auctions Sites! And I sell for less! And unlike those who will remain anonymous! I test Goods before I sell them. So not only can I sell you some Great New stuff! But I can sell you hard to find 2nd Hand Goods, partly because I'm the guy most people come to when they want to give their Ataris a New Home! I'm saving Orphaned Atari's from Oblivion! Goto http://BensCatalogs.Atari.org or Call (503)256-9974! I'm not asking a lot, I'm just trying to make a living and I'd like to earn your Business!

Hello!

I know, I have asked this question now and again, but does anyone know how to skip the boring (and most difficult) helicopter part from Infiltrator to get right into part two?

Or does anyone actually master the helicopter thing and could provide a saved state for Atari 800Win?

Well?

Frank

Hey Steve -

Well, I don't know about "cool" but some of the really neat things I have:

1. M.U.L.E. mug - I sent my best picture of the M.U.L.E. cover to "snapfish.com" and had them set the picture onto a coffee mug. So I have my morning mule mug of tea/coffee. It looks fantastic.

2. Dorky "Atari" t-shirt I made thru hewlett packards special iron-on material. It is a nice grey long sleeve shirt, with a rainbow colored atari-fuji symbol on it.

3. I still have the boxes, instructions and 5.25" disks from most of my favorite games, in good condition. A lot of this stuff is from Electronic Arts.

-ciao

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

I suppose he does. I only spoke to him briefly at Micropalooza.
The music was so loud, it was hard to hear anybody unless you were next to
the person and shouted. Lawrence Hiler (a.k.a. Mike Henry) went to the
post-Micropalooza bash at Jeri Ellsworth's house afterwards. Too bad I
couldn't go. I heard that he was telling great stories from the 1980's.

I kind of like seeing the Atari ads often. Reminds me of the days I was
running a BBS with an Atari Mega STe 4.

If you impose a limit on someone's messages, do you limit your posts to once
a month?

If you don't want to see messages from a particular source, just don't open
them or block them.

Sounds like a freedom of speech issue.

I suggested single-posting a while ago, and also waiting till the last ones timed out before doing so, in what I hoped was a relatively civilised manner. Looks like Ben didn't listen.

"Time out" in the meaning "not being present on your newsserver" varies
alot from less than a week to very long time, several years at least.

He gets his word out and the usual opponents get a chance to clatter with
yet another useless complaint. So far Mark D and Joakim Hï¿½gberg from
c.s.a.s alone. Email to Ben direct or shut up!

I must admit the main reason I have not registred Aicq (by Hï¿½gberg) is
actually his complaints about Ben Smith's ads.

I'm so very sorry, I haven't made a sale in over a Month, yet the bills keep coming in. It's hard now not just for me, but also Brad at Best and Lance at Video 61.. I know since we all keep in contact. Even with our Banner Ads on Atari.org things are painfully slow. I tried to Drum up some business. So I tried some new Ads. I wonder if Best Electronics or Video 61 Ran Ads here, would they get the same response? ===Ben===

Hmmmm..... Seems Ben is the only one around here doing any selling, in a
For Sale news group.

And to qualify as a legit post, I'm selling my 2001 Cadillac DHS for
$55,000.

Cash only. And will accept a best offer above the selling price.

Don

Lawrence Hiler? Is that his real name? Interesting...

Mike..er... Lawrence... is sort of a legend around here, for those involved in the 8-bit scene back then anyway. His name still comes up every now and then when I get together to talk old times with my old 8bit friends... hey we were all big time nerds back then.... well, some of us still are. :)

444. New SIO2PC/ProSystem All-In-One Interface Now Available

Newsgroup: comp.sys.atari.8bit
Date: 2004-01-24 20:15:53 UTC
From: Steven J Tucker <classics@atarimax.com>
Message-ID: <a8SdnWMBUuzkT4_d4p2dnA@adelphia.com>
Source record: 17351

I'm happy to announce the availability of a new all-in-one SIO2PC interface that combines SIO2PC and ProSystem cables into one low cost, jumperless and auto-switching interface.

Interfaces are available with real Atari SIO jacks, or with terminals. The SIO jack model will probably be a limited production, I doubt I will be able to get many more of the SIO jacks.

Prices for the first 100 standard interfaces sold are only $19.99.

Complete documentation for the interface along with photos and PayPal order form can be found at http://www.atarimax.com/sio2pc/

Steve

Don,
It was cross posted over several news groups....some set aside specifically for
marketing, some not.
Which leads me to this 'opinion'.

there is no comp.sys.atari.marketplace newsgroup.
That's not Ben's fault.
Where should he post?

So many folks demand free-ware and open sources....free information....but free
marketing is an absolute nono? Kind of hypocritical isn't it?

The posts don't bother me, nor do the complaints about them; however,
I really don't understand the personal attacks all this brings about every time
Ben posts anything here...ad or no. Some of it is down right vulgar to the
point of pornagraphic and intensely violent. There's simply NO CALL for
that...disagreement or not.

Brian

450. Software sprite performance

Newsgroup: comp.sys.atari.8bit
Date: 2004-01-25 12:36:57 UTC
From: yishyosh <yishyosh@hotmail.com>
Message-ID: <bv0d99$7er$1@sparta.btinternet.com>
Source record: 17357

I was wondering what kind of performance I could expect from a
state-of-the-art character-based
software sprite routine:

1) without masking, i.e. each character entirely replaces the
background character

2) with masking, i.e. each character is combine with the existing
background to yield a new character

Most likely movement will be in the x plane only for most sprites with only
the main character requiring x and y plance movement.

Hopefully I won't have to shift on-the-fly or have pre-shifted sprites as
the frames of animation will encode all the movement.

Alternatively is a pure graphics mode the way forward?

I'm hoping the an answer is at least 40 character sprites per frame, which
would allow anything up to 2 40x32 sprites.

Ta.

Please stop complaining about the ads. Ben even puts ADV in the subject. If you don't like the ads, it is so very easy to skip past them. Anything more than that, and you are really just trying to control the relationship Ben has with others. The complaints are far worse than the ads IMHO. Please live and let live.

Thanks

->quires 11.5v and a 9v 1050 PS is plugged into it, then I doubt it
->would cause any damage to the Indus... why would it?

This is a somewhat belated response, but since the above was a
reply to my post, I'll tackle it directly even tho others have al-
ready touched on the issue.

What you're missing is that the Indus takes direct current (DC)
whereas the original Atari Company hardware used alternating cur-
rent (AC).

As for power supplies with about 9.5V DC, anecdotal experiences
posted on this board have shown that you're right.

Regardless of what it "seems" like to you, that's simply not true. There is another dealer who regularly posts his ads here, and if you've been reading this board for years you would know that the Ben Smith-haters have never once complained about that dealer's postings.

Meanwhile, as the owner of Video 61 said on this base during another anti-Ben flurry a year or two ago, the other three remaining Atari 8-bit dealers in North America are afraid to post here because of the hostile atmosphere created by the anti-Ben crowd. There's no question in this case about which side is responsible and which side is continually irresponsible. Venting personal attacks based on cultural biases is simply irrelevant to the purpose of this message base.

->And to qualify as a legit post, I'm selling my 2001 Cadillac DHS
->for $55,000.

That is not a legitimate announcement on this base. It's off-topic. Ben's posts are on-topic.

Hello, friends,
Jeri Ellsworth has reported that after the latest Micropalooza
article in the Portland Oregonian newspaper, Ground Kontrol, the
retro-arcade in which we had Micropalooza, has had more sales than ever in
games, equipment, and arcade machine use. In other words, profit!

Hooray for the good guys!

Yes, GTA 3 with full 3D graphics.It uses a massive 1 Mbyte cartridge for fast data access, so the computer only has to copy data and not much must be calculated.

The frame rates are ok on a normal ATARI, but even better on accelerated systems.

I will release a demo, soon.

I don't mind the Bravo Sierra ads/promos at all!
In a group with a relatively small following [Atari.8bit], it's great to
have
Ben as an available resource.

It's not like were talking ibm-PCs where there are thousands of resellers,
and
you sure don't need an ad to find products!

Ben, if you are having problems moving merchandise lately then instead of cross-spamming the newsgroup with the same old message, how about actually having a sale to give people incentive to buy something from you? Or put some of your stuff up on ebay.

"Bravo Sierra Computers" <atari@aracnet.com> wrote in message news:Pine.LNX.4.44.0401230443350.12356-100000@onyx.spiritone.com...

->Sorta coy about the unknown 'other regular advertiser'?

Not at all. See next sentence.

->Dean Garrahty?

You're darn tootin' right! Congratulations!

->Haven't seen an ad from him in a long time.

So that proves he's a lot more active here than you are. He's
been posting his announcements here every week or so for the last
couple of years!

->I know my memory is bad, but I can't remember any other regular
->advertiser.

That's about the size of it.

->There are fairly often notices of auctions, those are good, they
->are single notices of sale of A8 stuff.'

Selling is selling. That's the point the anti-Ben posters (and
before that the anti-Ortman posters) have been mashing down our
ears (and modems) for years. I'm in favor of the sellers having a
right to post here and have said so, but the anti-Ben posters would
disagree with you.

Except they pick and choose which sellers to attack. It's about
time people stand up to their antics and their blather. As I said,
let's get back to technicals. If you don't want to read ads, then
when you see an ad in the message list, just skip to the next post-
ing on the list.

And your point is? (I know; don't tell me: only anti-Ben post-
ers are allowed to post here. Yeah, yeah, we've heard it over and
over. Give it a rest!)

Fact is those were three replies to three different postings.
So what? (Or as Americans are wont to say, "So *#%!@&-ing what?")

->I doubt any of this complaining/defending is going to change any-
->body's mind... really.

Thanks for throwing the softball! I really appreciate that! Now
I'm gonna swat that one outta the park! Your implication, of course,
is that everybody should just put up with the antics of the anti-Ben
crowd, with their intemperate language, personality attacks, and
overall bad conduct. You appear to be implying that the defenders of
Netiquette and good behavior and the right for some ads to appear on
this forum should keep quiet about the havoc caused by "the other
side" (to use Dean Rusk's memorable phrase) because otherwise there
might be -- oh, horrors, this is just too awful! -- a bit of contro-
versy hereabouts. Well, I got bad news for ya. There ALREADY IS a
bit of controversy here.

You're right on one count: opinions won't change. But it's
wrong to think that the rest of us should just keep mum while the
disrupters and juvenile delinquents wreak havoc. To the contrary,
a clear message needs to be sent to the crybabies that their bad
language and temper tantrums aren't appreciated here. They should
shut up or else we're gonna tell their mommies to take their com-
puters away from them. Then maybe we can go back to 8-bit techni-
cal talk.

This was mentioned about two years ago, in an earlier flareup of
the cultural war between Ben and his self-professed enemies: the
other three being Video 61 (whose earlier statement I repeated),
B&C Computervisions, and Best Electronics.

Frankly, the last time I looked at the FAQ there were dozens of
additional dealers and vendors listed, but based on mentions and
contacts posted by people on this newsgroup in recent years, Lance
would seem to be right.

> 2) with masking, i.e. each character is combine with the existing
> background to yield a new character

Depends on the size of the objects you'd like to move. Then go
and calculate. A one-byte load/store requires around eight
cycles for the 6502. A 16x16 object will hence require 2x16x8 = 256
cycles. 40 objects require then 10240 cycles.
A horizontal line has 114 cycles, and there are 312 of them in PAL,
giving you a total of 35568 cycles per frame (in PAL). Thus, theoretically,
you could run around 120 objects of 16x16 pixels size provided you do
nothing else. This is of course a flawed calculation since I did not
include cycles stolen by DMA.
Again, for antic modes 2,3, E and F, we have a total of 40 DMA cycles
for display DMA, 9 for memory refresh, one for DList fetch, leaving
64 cycles for the CPU. Thus,we arrive (approximately) at around 20000
cycles for a frame. Given that there is a certain overhead of actually
administrating the objects, and actually implementing some "game play",
this is pretty close. The cycle count does *not* include any kind of
shifting, yet. You would have to use pre-shifted objects, and possibly
a double-XOR technique to get the objects erased again. Then you're
at twice of the cycle count, and at the threshold.

Greetings,
Thomas

Ed -

I remember first stumbling upon this by accident when I was
programming back in the 80's. I'm not sure what the EXACT line is I
tried typing then, but the Atari slapped me and said "No.". Typing the
line, 40 DIME$="TEST3" will produce an error soon as you press
[return]! It's tiny brain sees "DIM" as a reserved word and can't
figure out what you're trying to do. BUT...if you type LET
DIME$="TEST3" then it will work. Back in the day, I don't think I
EVER used the "let" statement (c'mon - it took up precious memory!)
but it would bypass this problem for sure.

-regards & merry yaksmas,

Uhm I take umbrage. I did a 'find' in OE and the last post from Dean was 11/20/03. I don't think you'll find someone who comes here more often than me.
Yes, there for a while, back in June, July, August Dean G. was posting a lot of ads.
Before 11/20/03, I think he had one or two posts between 9/03 and 11/03.
I'm don't want to argue. Just I believe you're wrong about weekly posts from DG for at least 3 months.

Its ironic that some of the very people who support Ben's ad's are also very vocal on the subject of Spam in Usenet and how they are actively trying to set filters to get rid of anything remotely Microsoft posted, yet they happily accept Ben-Spam.

Hypocrites??

Very strange. Using the selling of my beautiful, well cared for, 2001 Cadillac DHS for sale ($55,000) ad in reference to anti spam, anti Microsoft comments. I've never been anti Microsoft. I think Bill Gates is as close to being a Saint as any CEO can get. Providing employment for literally thousands of people, being the at the top of the list as the most generous giver to charities. He's what German/Italians are made of, Saintly, Generous Geniuses.

BTW, Spam is associated with e-mail, not news groups.

Donald, The Magnificent!

Just for the record, it doesn't take up any more memory than just the assignment. Both explicit LET and implicit assignment get translated to (different) tokens.

Best regards,

Sidney

I found a firm that has in new in the box. I placed a order. If I cannot get it I will let you know.

Well I am collecting ALL 8-bit Activision cartridges for the Atari 800, thats the only reason I want it. Though I would love to get Pastfinder I like that game better!

Tim

> BTW, Spam is associated with e-mail, not news groups.

Actually this is not true, here is how dictionary.com describes spam:

"Unsolicited e-mail, often of a commercial nature, sent indiscriminately to
multiple mailing lists, individuals, or newsgroups; junk e-mail."

Here is the url, in case you would like to verify this:

http://dictionary.reference.com/search?q=spam

Just an FYI.

In the end, all this pointless bickering does is make this newsgroup look
bad as the size of the discussion thread
outweighs anything Atari-related... and that's a shame.

Hi,
Apologies if this seems like a for sale post, but what I'm really after is expert advice as to where I can get a reasonable deal on an old Atari 800 that was dumped on us by my bro-in-law 'some years ago'.....
Inventory is as follows :-
800 PC (beige keyboard style thing)
1050 Floppy drive + manual
410 programme recorder (old fashioned tape recorder thingy)
Joy stick
400/800 guide to effective programming manual & programmers card
6502 assembly language programme manual
Your Atari Computer - guide to 400/800 personal computer manual.
Writing Strategy Games in your Atari Computer manual
'Page6' Atari user mags, July/August '87 - July/August '88 (7 in all)

I'd prefer not to use e-bay. Any experts out there and is it worth selling or should I just nip down the local tip with 'em ?
Never used by us but was working when handed over to us 'all those years ago' !

Cheers,

Dave.

Ian,

I just checked it and it seems to be up and running... maybe it was just a
server problem... ?

Cheers.
Steve

I have a question about this. Can you just turn the atari on and it
recopgnizes this setup as a booting floppy? Do you need special
software running on the atari? The reason I ask is because I have a
couple old 8-bits, but I sold my 1050's years ago and my old disks are
probably curupt by now anyway. I think it would be neat for 20 bucks
if I could plug my 130xe into an old pc and have every game ever made
for it ready to go...

I mostly lurk this newsgroup, but I have participated on occasion (under a different user name).
What amazes me, is that even though the age of the Atari 8, and the (I suspect) age demographic of it's users (late twenties to 60+ years) that we would have such a childish display of flaming, bickering and disrespect. I expect more of my peers, and also would expect the kind of behavior I'm witnessing to come from adolecent juveniles. I guess the A8 still creates new (younger) fans to this day, or 'some' of the older users haven't grown up yet.

That is all.

The PC behaves just like a 1050 (except slightly quicker). No software is
needed on the Atari side. Only on the PC side.

No special software is required on the Atari. With the software
running on the PC, to the Atari your PC just looks like real Atari
peripherals.

The short answer is "yes". And nothing special is needed on the Atari. The Atari sees this as as if it is one or more disk and/or *hard drives*. Read the FAQs or Google (Atari) APE or SIO2PC or Atari 810.

But to temper my enthusiam just a bit, these interfaces can be a little tricky. My experience is that if you have a really fast PC and/or use Win XP, you may have a few "bumps in the road" before you get things working properly.

I was thinking of piecing together a pc with old parts I have laying
around, something that I would just use with the atari. I even have
an old matrox millienium card with VIDEO-IN, so I can I use an old pc
monitor with the atari just by plugging my atari monitor cable into
it... can I just download every atari game in ATR format? DO I need
to do anything else to them to get to work? This sounds pretty cool.

FWIW: One of my favorite computers for using SIO2PC was a Hyundai 10 mHz
8088 computer with built in video and serial ports. I just had an old 20 meg
Hard Card for storage.

Everything runs much better if you can find an old copy of DOS or DR DOS.

Source record: 17326

Hello. I want to state that I find the ads from Ben and the like very easy to skip past when not interested, and appreciated once in a while if I'm curious about his wares. I'm with you there.

As to those who complain about the ads and get their panties all bunched up... well I rather dislike them. Their complaints they ultimately justify, by pointing out that them having to deal with those ads wastes some time and possibly some bandwidth. When it would be easy for them to just skip past ad threads or even kill filter the ad posters, they instead spend how much time and transmit how much in their complaints. So quite literally, the amount of time or "bandwidth" anyone has to deal with ads in here is really not even a blink of an eye. No... these people have another, hidden, issue that motivates their endless, and quite frankly tiresome blather. It's an issue which drives them to try and control the interaction between other people; interaction which is none of their damn business.

But anyway, those people are easy to ignore or even kill filter if need be. So I'm not so bothered by their blather (I like that word, thanks to whomever used it in here recently) as you. For those people the real issue isn't the ads. The issue is about them being for the "one true way", and their ability to force, persuade, ridicule or shame others into that way. It's almost like they're saying "I'm great. I'm great because I have great ways. You should recognize the greatness of my ways (and thus me), and strive to aspire to my greatness." Anyway, that's the way I see those people. And I will kill filter any/all that tire me enough. I think when no one pays any attention to them that they shrivel up and die. ;>)

- The Lucasfilm games Ballblazer, Rescue on Fractalus, Koronos Rift
(Eidolon wasn't as nifty).
- Star Raiders (and II)

That's from a "graphical" perspective. For just plain fun I think
Archon was awesome and of course the Alternate Reality series.

My 2 cents.

Your assumptions are quite correct.
All you will need for your PC is either APE or SIO2PC or linux SIO driver or
Atari810 (there are also other programs) - depending on your OS.

APE is probably the best but requires registration for full functionality.
SIO2PC is uncrippled shareware and other programs are free.

Yes - you can download just about every Atari game in ATR format.
No, you dont need to do anything to those files - just load them up in PC
software - they would look just like floppies for your Atari.

Greetings,

j131

That had gr8 graphics henrys house, i dont know why they couldnt use the same graphic resolution and colours on every other game,which would have made them all great.instead they use greyscale or purplescale which made the game look mildly better than a speccy. :(

most Atari games were crap, because the programmer looked like they couldnt be botherd doing a good job.

On the other hand, your "blather" has some merit? Right? It's interesting to me that you stand by Ben's right to post whatever he wants but have the unmitigated gall to blast anybody that has a dissenting viewpoint? Even your little witless diatribe has some value in the context of free speech. If you would practice what you preach then you would have updated your filters/killfill silently, without the need for your grand speech... but you felt your opinion was worthy of public consumption... well, I have news for you... so do other people.

I have really nothing against Ben's ads (as long as they are done in moderation) but I do support people's right to have a dissenting view... your own attempt to "force, persuade, ridicule or shame others into" assuming your point of view by publicly asserting that they do not conform to your grade-school level psychology diagnosis is certainly contradictory to your own stated principles.

> No... these people have another, hidden, issue that
> motivates their endless, and quite frankly tiresome blather. It's an
> issue which drives them to try and control the interaction between
> other people; interaction which is none of their damn business.

In fact, when an item is posted in a public forum such as this... it IS everybody's business. I do wonder what hidden issue motivates your tiresome blather? Possibly to try and control the interaction between other people in this newsgroup?

> Their complaints they
> ultimately justify, by pointing out that them having to deal with
> those ads wastes some time and possibly some bandwidth. When it would

> ad posters, they instead spend how much time and transmit how much in
> their complaints.

Well, you set a mighty fine example here because you did just exactly what you accused others of being unable or unwilling to do. You want to condemn others for not quietly accepting whatever has been posted but you find yourself unable to do the same.

Funny.

That's a good idea.

BTW: an even better solution (IMHO) is if you can find an old notebook,
perferrably a small one. An old 386 or 486 will do just fine, just be
sure the harddrive is big enough. If you are lucky you should be able to
get it for free.

I've got a Compaq Contura Aero 4/33C (486MHz SX processor @ 33MHz,
8MB RAM) and it runs Linux and my AtariSIO program just fine - and it's
really fun if you are able to carry around your whole program collection
over to a friend/the local Atari meeting/... !

Speaking of programs: If you intend to use DOS on your PC, I'd
strongly recommend APE for Dos - if you are willing to pay the
registration fee. The starting screen and the limitations of the
shareware version are somewhat annoying, but besides that APE is
really an excellent program.

SIO2PC works also quite good, but it has some small bugs with
double density ATR images.

If you want to use Linux on your PC, the only (but very fine :-)
program is my AtariSIO software. Currently I'm working on a new
version with a completely new (curses) frontend with some new
features. ATM it's not fully finished (I still have to rework
ATP support) but it's already quite stable. Contatct me by email
if you want to have the current snapshot.

so long,

Hias

That's a bit harsh - a fair few, but not most ;)

Good 3/4 colour examples :- Zybex, Beer Belly Bert's Brew Biz.

Graphically good - LucasArts titles, Raindow Walker, Mercenary, International Karate (World Karate Championship)

I have an SIO2PC cable and a 1050 pro cable. I registered Ape for Windows and it is an excellent program and Steve does support it with regular updates. Steve's stuff is a bit on the expensive side... BUT it is always excellent quality and works as described. My only major gripe is that the documentation for Ape for Windows User Manual has "been in production" on the website for years. (http://www.atarimax.com/) so I don't feel I have been able to use the software to it's fullest. Since I personally cannot stand DOS programs, I decided to pay the $50 registration fee and be done with it. I can honestly say that I have gotten more use out of this $50 purchase than most $50 games I have purchased over the past few years. Also, you get more than a disk drive... you get an Internet modem device (although I don't know how to use it) and a virtual printer interface, among other things.

Oh also, I have an AMD 2800+ and WinXP and have had no issues whatsoever in terms of compatibility with the cable or Ape for Windows and my cable is at least 3 or so years old.

Cheers.
Steve

536. Re: Games that uses Atari 130XE memory?

Newsgroup: comp.sys.atari.8bit
Date: 2004-01-29 19:34:56 UTC
From: mstepansky@aol.com
Message-ID: <20040129143456.13001.00001291@mb-m02.aol.com>
Source record: 17343

"Shrink XL" for the Atari 800XL (64k) to trick the memory space into "128Kb" of RAM? COOL!!

Reminds me of RamDoubler or Tripler for Macs.

Where can I get Shrink-XL/XE?

Sorry for the confusion in my earlier postings about ROI (Realm of Impossibility), when I said "3D maze", I do not mean by "Doom-3D perspective" kind.

If you remember "Paper Boy" game, where it is sort of aerial type with buldings at angles; but not much colors in ROI.

BREAKING NEWS!!

In "Airball XE", it says it requires "at least 128K of ram" - when I use Atari800WinPlus3.1 emu. But the guy at the ebay who sold "Airball XE" cartridge said "...this game should work for XL as well, according to the Airball XE box."

Hmm....conflicting memory requirements. I need to confirm if Airball XE is working in XL or not. I am unable to find such Airball.atr file to test out on emulator. Airball reminds me like SpinDizzy.

Also, 'VideoBlitz' - a 3D graphics demo for XE works (if you use 128K mode, otherwise, it flicker 2 frames in a loop in XL mode). An good test for your XE emulator.

'Grud in Space' uses up about 71k of RAM...but it probably uses the main program (the frame loader, phrases parameters, etc) plus active graphics data within the XL memory space. The rest of the extra data (in 71k file) is probably for different graphics. It is on DiskA/B.

'Grud in Space' is a fun graphical adventure for 800XL using Graphics#8 but somehow it uses color nicely - where you explore and meet new aliens and hazards on planets. You use objects, teleportation codes, orb colors, caves explore, mothership rooms to find objects, etc.

Good old adv. map drawing days!

Mike

Oh yes, it took up MY PRECIOUS MEMORY!!!
I was able to remember one more basic statement by purging the "LET"
command from my sore little brain.

Definitely International Karate is the best. Very interesting is also
Another World and Lemmings conversion named Brundles /impressive on
XL/XE/.

The coolest thing I ever own is this:

Atari Silver Jacket (1982) with blue stripe on armsides, with the silver word "Atari"; it has blue circular Atari "rainbow color" logo on my chest. It is VERY RARE as most jacket has "silver" logo. :o)

SIO2PC cable, to be able to connect Atari to the master server, the PC - so I can burn some files or favorite games to keep for years to come.

And Atari800XL to explore many possibilities, programming, games, graphics, Touch Tablet - the pivotal point which leads me to computer graphics field, which I end up getting involved into SGI (Silicon Graphics Iris) workstations now and then.

And...Atari Scuba diving tank....just kidding...

- The Lucasfilm games Ballblazer, Rescue on Fractalus, Koronos Rift

- Star Raiders (and II) or "Last Starfighter"

Yeah, I agree.

Now my picks for the best 3D games with "great", "most colors" graphics to the "strangest" or addictive on Atari XL/XE, not in order:

-Nadral, one of the strangest aerial maze-room adventure; it uses strange colorful, rolling-patterns; has voice synthesis (speaks German "speiler los"); and has one of the strangest reverbed spacey sound efx and ends up with lovely music.
(the only other voice synthesis game is BioDefense and PokerSAM)

- Landscape (or "Stealth"), very nice mountains at the horizon; youre riding on Stealth plane, hovering over the 3D perspective desert roads with enemies; collecting energy sources at your pace, etc.; goal is go toward the Dark Tower in the center of horizon and destroy it, assuming you have enough time.

-Mr. Robot, simple but highly creative objects (ie. trampoline, bombs, teleport, magnets, etc!) - colorful "level-based" game. I still fell in love with this one and its challenges. Cute! I made it up to "Level L" without cheats.

-Ollie's Follies, if you like Mr.Robot, then you ll like this one; it has more 3D looking objects, levels, to it. Has teleport, fans, tunnels, many nice challenges ahead!

-Cohen's Tower: if you like Ollie's Follies, but dont care of graphics, then you will like Cohen's Tower; elevator-level game with "mailing" objectives. Hard.

-ElektraGlide, UK disk version of Pole Position; very nice 3D arcade-graphics feel to it. Nice sound. I was unable to finished it because it is hard!!

- FlipFlop, a nice 3D-topsy-turvy, floor-level mazes (floor titles and ladder that is). One of my favorites next to HERO; got up to Level 14 so far.

-Flak, good graphics (shows CPU, chips) , nice smooth scrolling, but very difficult version of Xevious.

-Grud in Space, a great graphic sci-fi adventure; my only favorite graphics adv. for Atari XL (the other adv were too hard or textual-based)

-Electrician, a good challenging game where you have to fix broken electricial wiring in houses; ok graphics but good plot.

-HERO, Oil's Well are one of the few addictive games (after got tired of Pacman).

-Encounter (Battlezone-clone): uses 3D effects, especially how the bullets scale from tiny to LARGE BALL in front of you; before it kills you! No 3D glasses required!!! :o)

-AgentUSA (or it should have called "Where in the USA is AgentUSA?"); you are CIA agent, with your head tucked hideously under hat and trenchcoat; EXCELLENT educational game for kids/adults; for memory reinforcement to know your correct train schedule after you buy ticket; it keeps you going;...also...

ahem....probably the ONLY Atari games to have WTC - World Trade Center blg. in the background.

they made Another World for the 8-bits? Is this the same game I had
on the Amiga where you run away from a big bull and kick little black
snakey things? How could the atari handle that type of graphics?

Are we talking about the game created by Delphine software that was
originally for the Amiga and was ported for ST, SNES,
Genesis(megadrive) and PC? This was a 16-bit game, I cant imagine it
was done on the atari 8-bits. I'd like to see the 8-bit version.

well I'll be damned. I didnt realise anyone was still making games
for 8-bit atari in 1992. I must say, although impressive for the XE,
it is the lamest version of Another world I've ever seen.

Hi Steve-
I'm curious about your experience with APE:

> Oh also, I have an AMD 2800+ and WinXP and have had no issues whatsoever in terms of compatibility with the cable or Ape for Windows and my cable is at least 3 or so years old. <

Interesting. What is your PC FSB speed, and do you print with APE?

Also, do you use XP Home Edition or Professional and what release version of APE do you use?
Thanks,
Larry

Hi Everyone,

Thanks for all the replies...a very interesting list. It seems like a lot of people really like the games from LucasFilm.

As an extension to my original question, what are the games that are available for the XL/XE that are "best of breed." Games that are exclusive or designed specifically for the platform (like Star Raiders II) and takes specific advantage of the Atari hardware?

Mike

you noticed that too? the beginning where you climb out of the water
is pretty sketchy, I mean, if you hadn't played the game on another
system it would be impossible to figure out whats going on. Still it
is quite an achievment considering it is running on hardware that
first saw the light of day in the 1970's!!! I'm still suprised a
company like delphine was willing to put that kind of time into an
atari port. Does anyone know if this was converted from a commodore
64?

Do u mean converted too a c64 or converted from a c64, only i don't think
the c64 had version of it,and i dont think delphine did the conversion, i
think it was a homemade job.

Hmmm,
well here are my suggestions:
- AR City+Dungeon,
- Rescue on Fractalus
- Koronis Rift
- The Eidolon
- Ballblazer
- Henry`s House (low budget, but great graphics!)
- Mousetrap (Microvalue/tynesoft)
- BC`s Quest for tires
- Herbert (a german game with a duck)
- Wloczykij (= The wanderer, a polish Jump & Run game)
- Space Harrier (now in the making)
- Super Mario 3 (currently under development!)
- International Karate / Karate International / world karate
championships
(one and the same game, just different names...)
and many many more games...
-Andreas.

Well,
I can send you a copy of Shrink XE and other Disk or File packers. Just
send me an e-mail... Airball is a bankswitching cart, meaning it
requires only 64k if you have it on a cart. If you have a pirate copy
(=ATR), this one cannot use the bank switching technique of a cart and
thus requires 128k RAM. Otherwise said: How do I get a 128k-4096k game
into a small 64k computer? Answer: Use an Atari and its bank-switching
cartridges, that will make it work... -Andreas.

[snip...]

Well,
what about the voice synthesis in games like Ghostbusters, ET, Berzerk,
Whomper Stomper, Deflector, to name just a few ... ?!? -Andreas.

Well,
an unfinished version (a sort of demo) exists for the A8. Think it uses
4-color graphics (was it Gr. 15 or just gr. 7?)... Alas, the game is
unfinished and does not work well on upgraded computers (on 48k or 64k
machines it seems to work alright)... -Andreas.

Yep,
thats the game. Available as a playable demo for the A8...
The intro screen says "Copyright 1992 Delphine software", allthough the
author of the A8 version was/is an Atarian from Poland... -Andreas.

Hmmm,
maybe: Encounter (really fast), Star Raiders, Star Raiders 2, Dropzone (also very fast) and many more games. To me "Pitstop 2" is a good example for a bad conversion, it is much too slow for a F1 racing game - but maybe thats because it was converted from the slower C64... A lot of mastertronic games are also bad and mostly buggy conversions (like Universal Hero - it does not accept the given password, Colony - after a while garbage appears on the screen, etc.) looks like these mastertronic guys converted the games fast, but never tested them fully on the A8, so they still include bugs... -Andreas.

Nope,
it was not Delphine software that ported it to the A8. The unfinished A8
version was done by someone from Poland in his spare time (afaik he
coded this demo in a few hours)... -Andreas.

so it's a demo? It said delphine software so I assumed it was
official. Is the game complete? I cant get it to run properly on my
emulator and until I buy one of those SIO2PC things, my 130xe is
dormant. The best I can do is get to the little beetle things that
are slug/snakes in the real version, but I can't get my guy to jump
over them. Whoever did it in his spare time did a good job, he
deserves a medal.

You are not only rude, but apparently not very comprehending. Perhaps
you are on edge because the truth might have hit a little too close
for your comfort. My view has been clear and consistent. Basically
it's that Bens (or other similar) ads usually do not interest me, but
I do not mind them being here. They are easy to skip past. Rather
than live and let live, you have to raise a fuss. I also stated that
I don't much care for that, but it's not that big of a deal either.
Even so, I am free to publicly comment and criticize the fuss you
make. Now that you get a taste of your own ugliness it is very
evident that you don't much like it. Why not see the elegant lesson
in all of this and stop casting stones if you do not like them cast at
you. As long as people such as yourself have to make a fuss, I will
criticize it when I feel like it, ignore it when I don't, and kill
file them when it becomes obvious there is no hope of civility and
tolerance.

So hey there chief... have a nice life at master control.

Likewise I went with the same set up (both cables and the Windows version of APE and Prosystem). I pretty much agree with most of SteveV4Vs sentiments. I would like to say also that I have trouble sometimes getting two 1050s to be recognized at the same time. It is hit and miss. Attaching just one drive works every time. Mostly I wanted to turn my disks into image files. Man does that Procable and software work well for that! On the other hand, I did try the APE system once and it didn't work for me. I fiddled with it a little but didn't bother to ask Steve (of Atarimax) or go to any great effort to make it work. So please understand I didn't ask for any help. I did ask him for help with the Prosystem and Steve at Atarimax was fairly accessible. Anyway APE was a side interest for me with possibly a future use. Making images was my main goal and it is working out well for that. Since my HDD are all in NTFS, DOS is out of the question without setting up (yet another) PC just for it.

Perhaps if the manual were updated for the Windows version I might have an easier (quicker) time of it getting APE to work.

Yeah, I know how it is.. I ported OpenGL to the Atari 400 and then slammed
Unreal 2003 onto it, but I had so much time on the 6502 left between frames
so I wrote a tcp stack with a web server into it with a cgi driver to
control my coffee pot.

Unless the .ATR image thing is different from the actual product, you're
supposed to squash those critters. Hold the button while you have the
joystick in the down position.

I find the game rather difficult to play, like so many other non-U.S. Atari
computer games. :)

I was using an emulator called Atari 800+ but today I downloaded
xformer 2000 and it seems to work much better. I'll need to give it a
try with that. Speaking of hard to control. I decided to snatch up
some old games I played on my 130xe like Zybex which I completed about
14 years ago but I cant play for more than 2 minutes now. It's funny,
but most of the games seem alot better when you remember them then
when you actually sit down and play them.

I hate the stupid keyboard joystick too. What can you do?

Hi,

The game had a bug that prevent you getting passed this point.
(see http://www.atariage.com/forums/viewtopic.php?t=23848)

I've uploaded a patched version to:
http://www.mkeates.force9.co.uk/uh_good.atr

Enjoy,

Mark

> XL/XE series?

Lucasfilm games like "Koroni's Rift" feature graphics that probably cannot be done on any other 8-bit computer from the 1976-1984 era. Although the pixels are a bit blocky, the number of colours used make up for that.

A game that is less Atari specific but still good, is "Karateka" by, I think, Datasoft.

Among adventure games with graphics, "The Institute" has spectacular artwork, particularly the on-screen appearance of famous, or infamous, human characters is excellent.

Some games have graphics that are not so impressive if one looks at screen shots, still these games offer very atmospheric graphics when in action. One example I can think of is "Maxwell Manor" by Avalon Hill. Another example is "Master of the Lamps" by Activision. In Atari's "Pole Position", the strength is not in details, but in the fine tuned overall graphics impression.

Some tiny games are special. "Alien Ambush", very simplistic, looks "cool" in action.

Anders

> i think you have the composite video and luminance.. composite playing the part of chroma.. <

I've never tried this, but it might be very useful for many folks with 800 XL's.

But is there a potential problem with with signal overload? Or perhaps the S-video receiving device is filtered to only receive the chroma portion of the signal as part of whatever "noise" cancellation it provides?

If you want to check the bbs... give it a try.

The bbs can only accept one connection at a time, so if someone is online (or when I'm testing) it is not reachable. In the future it might be a 2 line bbs, but that's not sure.

Some screens has to be translated

Some info is not update (the bbs says it's only online between 0:00-08:00 cet... but that's not true... the board is reachable 24h/7days a week now)

just give it a try. It's free.

telnet://213.10.217.144:8888

There are bugs (in time, and the download is not working grrrrr... but i'm working on it)

Greetz,
Marius

Xformer is probably the fastest emulation but far from the best. I
suggest AtariWinPlus or Atari++ emulators.

I am trying to clean house and I believe it is time to let go of my Atari 800XL. it has 2 disk drives, a tape drive and printer. I have a few Ultima games and many other programs to go with it. I bought it in 1983 while in the army stationed in Germany so it does have the 220 and 110 power supply for some of the hardware. I am thinking of the salvation army but thought I would check here before I do.

I like it better than Atari800win 2.6c, which is what I was using before. Is there an emulator that lets you decide which keys are which? I want to redefine the joystick keys. I dont mind the way xfoprmer sets up them up, but I want the fire button to be in a more convienent place.

I have found that Composite always works as a Chroma source. The circuitry has to "find" the color burst in the sync field where there is no Luminance anyway. So, this never seems to be a problem. In fact, this is why the s-video looks so good - the Luminance signal in a Composite output has to be filtered to eliminate anything above 3.5 mhz or so. The s-video Luminance can go out to whatever it wants (6-10mhz). On a s-video television, you should put a 75 ohm resistor on the Luminance (to ground) because the Luminance may overload its input. The Chroma is usually OK since we only look at the phase of the signal, not its amplitude, although it is a little "noisy".

Just as an FYI... I hooked up the composite output of my XEP80 80-column box through a Pelican S-Video-to-VGA converter ($50 at Best Buy) using an RCA-SVideo adapter and it too looks really good. The main output of the 800xl to VGA also looks good... it could be better but is a big improvement over the standard composite output.

> You are not only rude, but apparently not very comprehending.

I think you should go back and reread past posts before you continue to make a complete ass out of yourself. I am rude when dealing with ignorant fools and I comprehend just fine.

> Perhaps you are on edge because the truth might have hit a little too close
> for your comfort.

LOL, well professor... you are completely and utterly incorrect. I do have to say that your grade-school level psychology diagnosis is rather embarrassing for you. You are simply making an absurd suggestion then basing an entire argument around it. You don't know me well enough (or at all for that matter) to make any judgements like that, you are not even informed enough to understand that I have no problem with Ben Smith or his ads nor do I have any problem with Steve Sweet's opinion. I do have a problem with trolls like yourself attacking people that have a valid argument about something going on in this group.

>My view has been clear and consistent. Basically
> it's that Bens (or other similar) ads usually do not interest me, but
> I do not mind them being here. They are easy to skip past.

Clear and consistant by whose standards? I do not mind Ben Smith's ads being here either and if you came into this argument informed then you would already know that. So already your "clear and consistant" view is also devoid of the basic facts.

>Rather than live and let live, you have to raise a fuss. I also stated that
> I don't much care for that, but it's not that big of a deal either.

Again, you are speaking from a position of complete and total ignorance. My fight has been with the trolls (which now includes you) that try to belittle those that do have an opinion against Ben Smith. I am not complaining about Ben's ads, I don't care about Ben's ads. For your information troll, I am SteveV4V, Steve Sweet is the guy complaining about Ben's ads. You may want to actually find out what is going on before making accusations that are not true.

> Even so, I am free to publicly comment and criticize the fuss you
> make. Now that you get a taste of your own ugliness it is very
> evident that you don't much like it.

Ugliness? huh.. so anytime somebody has a different opinion than you.. that is considered ugliness? I consider that free speech. You have tried to

belittle people with a differing opinion than your own... I would call that ugliness.. but again, being the hippocrit that you are I suppose that when you do it, that is just teaching people a good lesson.

>Why not see the elegant lesson
> in all of this and stop casting stones if you do not like them cast at
> you. As long as people such as yourself have to make a fuss, I will
> criticize it when I feel like it, ignore it when I don't, and kill
> file them when it becomes obvious there is no hope of civility and
> tolerance.

Civility and Tolernace... interesting...

Oh, I stand corrrected... you are just trying to teach people an "elegant lesson", not a good lesson. LOL. I am almost insulted not by what you write but by the fact that you write what you do out of ignorance of the facts. You were the one that went out of their way to enlighten us with your opinion so the at the very least you could have the proper manners to ensure that those you accuse are guilty of the infraction you accuse them of. To catch you up on the facts since you obviously have not bothered to read the whole thread: Ben posts his ad, Steve Sweet complains, the usual suspects personally attacks Steve Sweet for having a negative opinion of Ben. I then tried to diffuse the situation politely then the trolls attacked me... apparently their backs were already up in the air.

Now keep in mind that Steve Sweet did not attack these people, they felt compelled to attack him because they don't agree with him which is pretty much just exactly what you have done. I will say this once again as it appears that you are slow to comprehend... People like you who claim to be tolerant are actually only tolerant when you share that same opinion. You may be tolerant of Ben's behavior but you are intolerant about those that have an opposing position. How you can attack and accuse people you don't know of having psychological problems and then try to convince people that you are tolerant and civil is utterly ridiculous. The only person in here making this so-called "fuss" is you and a few other known quantities.

Now, to educate you a bit... here is my first posts on this topic and the unwarranted foul language that was posted in reply. I posted a reply to the person that goes by the name Roy G Biv. Now notice, the first post I made in this thread was simply "Three posts in a row?" which was meant to imply to Roy G Biv in a nice way that he was out of control. He then went on the attack, resulting to foul language then went on to berate others for using foul language and exhibiting bad behavior (apparently oblivious to his own).. not me, I didn't use any foul language or raise any kind of a "fuss", I just tried to politely put and end to it. Anyway, at this point I am glad that I was able to identify some mental midgets that troll around in here that I was not aware of before. Your posts have also enlightened me in this regard.

Read on... witness my extreme psychological problems at work professor:

On Mon, 26 Jan 2004 at 01:40:50 GMT, "SteveV4V" scribbled:
->Three posts in a row?

And his reply was:

"And your point is? (I know; don't tell me: only anti-Ben post-
ers are allowed to post here. Yeah, yeah, we've heard it over and
over. Give it a rest!)

Fact is those were three replies to three different postings.
So what? (Or as Americans are wont to say, "So *#%!@&-ing what?")"

Did I use any profanity in my post? Or anything remotely deserving of foul
language? Nope. I went on to write:

->I doubt any of this complaining/defending is going to change any-
->body's mind... really.

Here I was trying to help diffuse the situation and of course was the victim
of one of this person's rants...

"Thanks for throwing the softball! I really appreciate that! Now
I'm gonna swat that one outta the park! Your implication, of course,
is that everybody should just put up with the antics of the anti-Ben
crowd, with their intemperate language, personality attacks, and
overall bad conduct. You appear to be implying that the defenders of
Netiquette and good behavior and the right for some ads to appear on
this forum should keep quiet about the havoc caused by "the other
side" (to use Dean Rusk's memorable phrase) because otherwise there
might be -- oh, horrors, this is just too awful! -- a bit of contro-
versy hereabouts. Well, I got bad news for ya. There ALREADY IS a
bit of controversy here.

You're right on one count: opinions won't change. But it's
wrong to think that the rest of us should just keep mum while the
disrupters and juvenile delinquents wreak havoc. To the contrary,
a clear message needs to be sent to the crybabies that their bad
language and temper tantrums aren't appreciated here. They should
shut up or else we're gonna tell their mommies to take their com-
puters away from them. Then maybe we can go back to 8-bit techni-
cal talk."

Ahhh yes the Atari800Win 2.6 lets you redefine the keys. So does the much newer 3.x series of it. I'm pretty sure Atari++ does too. Pray tell what on earth do you like better about Xformer over the other two mentioned? Xformer compatability leaves a ton to be desired by comparison. As far as speed, todays hardware runs the "slower" emulators just great. Check out the documentation. You might find some cool features that Xformer only dreams of!

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

No, I can't speak to using a RealTime cartridge personally, but I can
tell you that I am very happy with previous cartridges I purchased
from Sunmark. I purchased InstaDOS and MultiGames 02.

RealTime looks to me like it would have limited use to someone who
doesn't use SpartaDOS. It does the time/date-stamping of files in
SpartaDOS. And then you can evidently read the time from your own
programs, but this feature is only going to work for those who have a
RealTime cartridge. If the cartridge supported BeweDOS I might get it,
or maybe if the wizards of Sunmark crammed in some Atari BASIC
extensions like autoline renumbering, or maybe if the cartridge also
offered memory expansion (is that possible?) then I would get one.

But I will say that the quality of Sunmark products is very high in my
experience.

There was a whole period of advanced Atari 8bit programming that I
like to call "the Polish Renaissance" that occured after most 8bitters
in North America stop using their machines, I think like from 1988 to
1995 or so. It is amazing the quality of the stuff that came out,
whether it was Another World or the port of Barbarian or SOS Saturn or
whatever.

Worked fine when I connected . 19.2 was a little slow, but what can
you expect from a 130XE that I am guessing is running over serial thru
the PC?

Very interesting. I thought I was one of the last hold outs on the
8-bit. I was still using one in 90/91 when I switched to the Amiga.
One cool thing about the amiga was you could switch into "pal" mode
via software, but on the atari it required some hardware hacks, so
most of the euro software was unusable on the 8bits.

I would love to check some of this other software out.

I have an original ICD Realtime-8 cart, but it is not Y2K compliant.
Is there a way to make it so or is there a knock-off that is?

Uhm... Seems like the RT8 will work OK, that it is the TDLINE that won't
work. FTEDOS 3.2g or f had a Y2K TDLINE. And Tom Hunt wrote one also. Of
course, this is SpartDOS only.
You can find Tom's CTHTDLINE at my site:
www.en.com/users/russg
Of course, it has been so long since I used the RT8, I could be wrong.

Source record: 17161

Ahh.... Been playing 'Moon Lord' from ANALOG.
It is my speed, I just have to be careful with the emulated joystick.
I mention that I had to use both CTH archive at spudster and Holmes' archive
to get it to work. The main BASIC program is busted in the moonlord.arc at
CTH and Holme's archive doesn't have both the moonlord.ml and moonlrd.fnt
files that have to be on D1: when moonlord.bas is run.
I'm away from home and amusing myself with XLIT and Atari800 Win Plus 3.0.
I got Holme's disk from Steve.
MoonLord won't run on XLIT, it errors out with every 'phaser' attack,
whereas A8WP works fine.
So, if you wanna try it, I guess the moonlord.arc at spudster has a busted
.bas file.

Source record: 17162

Hi,

I got the Atari 800 that was posted in here a couple of days ago - it's in lovely condition - and was wondering how hard it is to get memory card boxes? It's fully populated with 48K, but I'd quite like to case the 2nd and 3rd boards, which are presently exposed.

Seems to be a GTIA model, as I can play Rescue on Fractalus on it :)

Well,
as said before, it is a demo and unfinished/incomplete. The author is an atarian from Poland, think he wrote "Copyright Delphine Software" on the title screen, because they have the copyright for the title (Another World) and the game idea. Besides, I also could not jump over these little beasts, mostly my player got split into two halfs (and after a while into garbage) and there was nothing to prevent this from happening. But a friend of mine told me that this game works alright on his 64k computer - so I assume that it has to do with my RAM upgrade (or my friend did not notice the bug and/or never reached that 2nd screen to the right)... Anyway it is a game-demo, nothing more and in my eyes nothing impressive (especially nothing really playable/enjoyable) unless someone removes the bug(s) and or completes the game... -Andreas

Message-ID: <401E5070.AAC20727@students.uni-mainz.de>
Source record: 17165

Well,
there is only one solution: Copy the tape to disk, take out a sector
editor and change some bytes in a certain sector (I do not remember
right now), then it will acceppt any given password. Looks like in
Colony there is also a solution to prevent the bug: When you order some
items you should normally switch on the beacon (or whatever it was
called), so the spaceship could find the landing area and place all
ordered items there. If you do that, the screen will be filled with
garbage, as soon as the items have arrived on the landing area and you
enter this screen. So, switch off the beacon (or keep it swiched off),
so that the spaceship will not find the landing area. As a result, the
garbage does not appear, but you now have to search the ordered items
all around...

In Rockford (another game by Mastertronic), level 9 cannot be solved,
due to one diamond missing. Again, copy the tape to disk, take out a
good sector editor and change some bytes, so this level will allow you
to collect one (or more) diamond(s) less than normally nescessary. Afaik
there are 2 more Mastertronic games where the last level cannot be
solved or played and some more Mastertronic games that have strange
bugs. As mentioned before: Mastertronic = the master company of game
conversions (to/for the Atari), but also the master company of game bugs
or buggy games... -Andreas.

Yup,
the DIR contains various game screens, alas, no matter if the game-demo
has 5,6,7 or more scrrens, due to the bug the game already ends in
screen 2 (on the right side). There is also a screen left from the
starting screen, but you cannot do anything here... So overall, this
game is pretty unplayable and sucks !!

Yeah,
and I will port my (non-existing) 160 gig XBOX harddisk to the A8 and
convert all XBOX games to A8 format, harharhar... -Andreas.

Yep,
I know that I have to do this - but I cannot, because my player is
splitted into two halfs when it reaches that screen. Then these two half
players do not accept any trigger or button anymore. I can leave the
screen to the left, but whenever I enter the screen again, the player
gets more and more destroyed and more and more garbage appears on the
screen instead of the player... So, there is a bug in screen nr. 2 (on
the right side)... -Andreas.

what impresses me is not the actual gameplay. Like has been said
earlier it's more a demo then a game, but it proves that game could
have been done on the atari 800xl. If they took out the first scene
which is so poorly rendered on the 8bit that it doesnt make sense (the
man being dropped into the water, which is a 3d animation in the
original) and made your character a bit more defined+completed the
game, it would have been a worthy port of the original. That was one
of the best games for the Amiga when it came out (they called it Out
of this world in the US), by this time the 8-bit atari (except in
Poland) was dead in the water commercially (and had been for awhile)
also Atari had officially discontinued the product. It would have
been nice if they did make some games that pushed the Atari's limits
around that time.

Not sure if this is a proper forum, but:

I have some Atari 8-bit stuff that I'd like to sell. Main components are 800 (48K) and 1200xl (64K) computers. There's a 1050 disk drive, non-working 810, and other stuff too. If there's interest, I'll post a list or can email with photos. South Florida location - may be important due to weight for mailing - all components include power supplies that add pounds up fast.

Hi,

Just the patcher - I did this when at University (over 12 years ago!). I sent my version to Jindroush last year and he compared it with other patches and then incorporated it into a know good image. This is the file he sent back to me.

I patched other titles last year, mainly the OS/B problem games, e.g. Shamus and those can be found on AtariAge. More recently I'm reworking the Eidolon and Koronis Rift to run from cartridge. I've also reverse engineered Colony and at some point intend to find/fix/rebuild the game as it was a great game.

Regards,

Mark

until 1995 I used an Amiga 500 (non-accelerated) with 8megs ram and a
135 mb hard drive to access the internet. Of course the fastest
method available to me was a shell account. If you have a cable
connection and it is still slow, try using Opera or Mozilla both are
much zippier than IE. Just an idea.

Logarithmic. Besides, you might have trouble getting linear pots at 1MOhm.

So long,
Thomas

Just get a can of color TV tuner cleaner and spray down the pot with it.
Twist ten or twenty times and I bet it works again.

Here's a list of the primary items. There's some software, all
connecting cables, cartridges, manuals, disks, ribbons, etc., but it's
primarily a group of hardware as follows:

1. Atart 800 PC 48K - with power supply
2. Atari 1200XL PC 64K - with power supply
3. Atari 1027 Printer - with power supply
4. Atari 410 Program Recorder
5. Atary 1050 Disk Drive - with power supply
6. Atari 810 Disk Drive - not working
7. MPP-1150 Printer Interface
8. Star NX1000 Printer (9-pin dot matrix)

Note that all components have the original associated cables and power
supplies. I'm told that's a rarity. Give me an email address to send
photos.

Sorry Tim.

I have a digicam but I'm in a different city than my Dad who has the computer. The scan of the manual was all he was able to do. I did link to a google image search for similar pictures but that's the best I can do.

I don't know what else to say other than I've posted a lot in the rec.bicycles.marketplace newsgroup over the years. Hopefully you'll see that there aren't hordes of ripped off cyclists out for a piece of me.

It's a working classic atari computer. My Dad doesn't bs about his electronics so you'll be getting a nice atari 130xe if you win the auction.

Hope that helps.
Julian

Aha! I was wondering about that. From the description it sure
sounded a lot like a game I remember a colleague having for his PC.
That game was called "Out of this World" and I think it was badged by
Interplay. I thought it was really cool on his 486SX25 and
soundblaster (the original soundblaster, not even stereo I think). I
remember us playing it after the power was finally restored after
hurricane Andrew. My poor Atari was still back at the base (fate
unknown for a while). Eventually my Atari was collected and found to
be in working order. My quarters were not blown all out over the
ground like many were nearby (even next one over). Base I'm referring
to is Homestead AFB, ground zero for Andrew.

Firstly many thanks to everyone that helped with my first question, I now have a pair of controllers that work perfectly.

Now another! After checking all my Ataris I found that my XEGS has a bad AD converter; it seems to be dropping the last two bits and jumps every 32 counts. I need to know which chip handles the AD conversion for the paddles and whether the same chip from a donor 800XL could be used as a replacement?

Many thanks once again!

Duncan

> the same chip from a donor 800XL could be used as a replacement?

That would be POKEY. You should also check the capacitors on the paddle
input lines of pokey that are required for the conversion.

So long,
Thomas

I recall reading an article (in addition to the one in Mapping) that described the various revisions of the BASIC ROMs and gave some details and history on them. It might have been by the same author as the fixed program in the Mapping Atari book. I'm not sure.

I'm leaning towards it being a Compute! article sometime between 83 and 86.

Anyone remember this, and if so, could you send me scans of the article?

Thanks!

Karl

I just got done making a binary load of BASIC B.
Everyone will tell you 'C' is the best Atari BASIC.
Except me. I've done a lot of BASIC programming and
found 'B' to be the least hangs and other problems, staying
aware of the 'add 16 bytes' problem.

Source record: 17260

I just got done making a binary load of 'B' out of a ROM file.
I prefer binary load of BASIC and ASMED for use with emulators.
I'm away from home and play Atari every day on a PC emulator, mostly XLIT.
I do a lot of programming in Atari BASIC. 'C' hangs, saves busted files
that won't load. I prefer 'B'. Work with 'C' for a while and you'll see it
isn't superior to 'B'.
B was a re-compile, major improvement over A. C is a like 12 byte 'patch'
to B and introduces many more problems than is solves.
It was fun going back and making a binary load of a B ROM image.
All needed is an ASMED program to open E: and JSR CIOV, then close E:,
putting 160 in 106 to move the display list down so BASIC can load and run
at $A000. I forgot that you have to have the channel number times 16 in X
when making the CIOV call after setting up IOCB1.

It was probably "The Atari BASIC Sourcebook" or some such. I think it
was a Compute book and authored by Bill W. or another OSS guy. OSS
made Atari BASIC for Atari.

A while back I dropped in to mention the TelBBS site.
(Hooking 8bit machines to the Internet for the purpose
of running BBSes over the Internet.)

A couple people here responded, so I thought I'd pass
on that http://www.petscii.com now has a support forum
for people working on these setups. While my own
interests are in CBM based systems, we are NOT machine
specific.

Both software and interface designers are on hand to
answer questions for anyone needing help.

If you haven't heard about this, I welcome you to drop
into the website and join in some 80's style BBS fun.

> whether it was Another World or the port of Barbarian or SOS Saturn or
> whatever.

Actually I remember being quite surprised that they still write and sell such crap (sorry) back then. All (well - almost) of us already switched to Amigas, STs or more often - PCs, which weren't best gaming machines at that time - to say the least. Anyway the fact is that plenty of great games were written and published here in Poland. Mirage gives them on their webpage (http://www.mirage.com.pl/index.php?id=retroattack). I tried to contact them but even THEY don't know if it's complete list (probably not). On a sidenote - L.K.Avalon just recently was selling it VERY old stock. Unfortunatelly there's not much left for Atari...

Hi, I'm Ben Smith, proprietor of Bravo Sierra Computers! I'm an Atari Dealer/Reseller who occupies a unique niche in the Atari World! Most Atari Dealers stick to just selling NEW, I also sell Used/2nd Hand Atari Goods! So not only do I sell NEW Atari Goods at a competitive price, I also sell used Atari Goods you may not be able to find anymore at Swap Meets, Thrift Stores or even Auctions Sites! And I sell for less! And unlike those who will remain anonymous! I test Goods before I sell them. So not only can I sell you some Great New stuff! But I can sell you hard to find 2nd Hand Goods, partly because I'm the guy most people come to when they want to give their Ataris a New Home! I'm saving Orphaned Atari's from Oblivion! Goto http://BensCatalogs.Atari.org or Call (503)256-9974! I'm not asking a lot, I'm just trying to make a living and I'd like to earn your Business!

> Tell us what's new in this one!
Hi
ok
I made a cut & paste of the info in the help file !!!
(apologize for my bad english coz I'm French ;-)))

Best regards

/|\C.I.G.F.Y./|\

Released 3rd February 2004.

Atari800Win PLus 4.0 is an 8-bit Atari computer emulator based on the
Atari800 v1.3.2 and Atari800Win sources.

Added:

1) A new method of getting video synchronization with monitor's refresh rate
of 100/120 Hz has been introduced. See Advanced Graphics Options dialog box
and How to improve smoothness of animations for detailed information about
this feature.
Changed:

1) The minimum height of the status bar is set to a value that makes the
state indicators look better when small fonts are used in the Windows
environment.
2) The new sound engine is not reinitialized every time the sound options
are changed. This prevents the sound from getting noisy in some cases.
3) Some GUI changes for new Atari800 kernel features.
Fixed:

1) A nasty bug causing fatal crash of the emulator after selecting
Misc/Convert/ROM to CART has been fixed.
2) Fixed incorrect behavior of the emulator when switching between PAL and
NTSC video modes without rebooting the emulated Atari (vide the Reboot when
video system is changed option in the Advanced Atari Settings dialog box).
3) "Keysticks" and the emulated Atari keyboard should not be locked anymore
after pressing the Alt key.
4) Fixed some problems with switching to full screen modes (thanks to Itay
Chamiel for the bug report).
User-visible changes introduced by new Atari800 kernel:

1) Cycle-exact emulation upgrade by Perry McFarlane!Fixed display bugs in
"Master of the Lamps", "Mail Order Monsters" etc. Cycle-exact changes to
colours, GTIA modes, player horizontal positions, player graphics, even
cycle-exact GTIA11_DELAY ("Demonic Laughter"). Improved handling of DMACTL
changes in the middle of a scanline ("Decathlon", "Mail Order Monsters").

Emulation of a DMACTL width change bug.
2) New high-quality POKEY sound emulation by Michael Borisov!You may still choose the old sound engine by Ron Fries - use Sound Quality in the Sound Options dialog box.
3) H: emulation enhancements by Mark Grebe!Full support for the standard Atari DOS functions: Rename, Delete, Lock, Unlock, Note, Point, and Open for Update. Full support for subdirectories: CREDIR, RMDIR, CWD, ?DIR work in SpartaDos and BW-DOS ('>' and '>>' are used as directory separators). Changed the directory listing to look like the standard Atari DOS 2.0 listing (the sector count is based on 256-byte sectors). Support for the binary load commands.
4) Cassette handling improved by Achim Haertel and Piotr Fusik!Writing implemented and loading improved (blocks which pass on tape while the OS waits for a leader are skipped now).
5) Fixed MultiJoy and PORTB ("Road Race" works in XL/XE mode - didn't in 3.1).
6) Fixed Atari 5200 crash after pressing SHIFT and * in "Super Pacman".
7) Swapped GTIA and CTIA artifacting modes, because they were swapped by mistake in version 2.6b.
8) New cartridges type: Switchable XEGS 1 MB, Phoenix 8 KB, Blizzard 16 KB.
9) Added XF551 HighSpeed transfer emulation.
CAUTION: This version may still have some flaws related to the GUI under Windows Me/2000/XP.

664. Atari800WinPlus Question

Oh ok, how do I do that? Is there a way to create a blank disk image and
drop the .BAS onto it or something?

I have been into Atari 8's and C64's since '84. I have seen and have several flippy disks that have the C64 on one side and Atari XL XE on the other. But take a look at this:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3075507376&category=27181

How can one side have BOTH??? Never thought that was possible...

Tim

I do remember some of these and have one myself in my stock pile. I
thought it was weird myself, but works. Kind of like a CD-ROM with
both a Mac and PC version of software I suppose, just forcing it out
to a different track for one or the other.

New one to me, too. It would be interesting to know if the Commodore and Atari boot tracks (track 0) are physically in different locations -or- even if they have the same radial location, the other system's sectors would probably be "invisible". All it would take is a few boot sectors, then forcing each system to different tracks on the disk. But still, that's a really neat trick!

Hi

Atari Win plus 4 use Kaillera Client V0.9 for the network feature

so search on "google"...perhaps you find something that can help you

so sorry if I can do this..but I don't use the network game(still have a 56k
modem in my littlllllllleeeee contry ;-)))))

Best regards

Hmmm... Havn't seen that in ages. I got a bunch of stuff from my shool back
in 86/87 when they upgraded the cumputers they were using. I got 3 commodore
64's, and 2 C128's and a crapload of soft and hardware for free. A handfull
of the games I got were like that, including one REALLY stupid typing game.

I thought it was neat as crap back in the day. :)

Hi,

Does anybody have any experience with bad Freddie in a 130XE?
I have a clock signal in on pin 2, but nothing out on pin 37, and also
Freddie sets reset for the other chips.

So I sounds like a bad Freddie to me.
Or does anybody have another clue?

Regards,
Freddie 'Still alive'

679. Disk Library Program

Message-ID: <TB7Vb.13843$Rl4.11869@bignews5.bellsouth.net>
Source record: 17286

I used to have a program that would read the disk's directory and store the data the in a database. You labeled the disk 1A, 1B, 2A, 2B, etc.etc. and if you ever wanted to find a program you typed in the name, the program found it and told you what disk and side the program was on.

I forgot the name of this program and but would love to get it. Anyone else remember the name or know where I can buy or D/L?

Even with emulation this program would be great to organize all your files.

Mike

Hi Tim,

I actually hold a patent on the method you describe. A subsidiary of Verbatim
(Data Encore) produced such disks in the mid '80s. The method was called
"Intersystem formatting". I have a copy of Frogger which plays on an Apple II,
Atari, Commodore and IBM PC -- all on the same side of the disk.

How interesting! Can you explain how such a thing was done?
Without giving away your trade secrets. :-)

If it's a patent, you only have to look it up at the patent office. I think the
poster meant the following patent:

Go to
http://patft.uspto.gov/netahtml/srchnum.htm
and search for 4,562,495:

December 31, 1985
Inventors: Bond, Charles R.; Sturtevant-Stuart; Ronald M.

For more information, look there.

(Hint: I always press on "Images" at the bottom, as I find the original
images more friendly in reading than the text only representation.)

HTH,
Spiro.

Maybe it has something to do with Atari and C64 having their
directory tracks in different places. I know that the C64
directory tracks begin at about track 18, in the middle of
the floppy diskette.

so you could have one disk that had IBM, Commodore 64, Apple II,
Atari 800 software all delivered on the same floppy. It's interesting
that they mention this could be used as a form of copy protection. I
suppose devices like the Happy drive for the Atari 8-bit could still
make a duplicate of this type of disk without a problem.

Hello, friends,
Hurrah! Photos from the December 30 Portland, Oregon Micropalooza
8-Bit Music Party have been posted to Earl Williams' website. (Thanks,
Earl!) Go to

http://www.earl-ydesigns.com/InfiniteLoop/comminfo.html

See such luminaries as Dave Moorman, Lawrence Hiler, Seth Sternberger,
and Jeri Ellsworth. Vicariously participate in the party while as you
view photos of the bands -- Waxin' Wary, gotoXY, and 8-Bit Weapon --
and the crowd grooving to the music.
My favorite photo -- Jeri Ellsworth being presented the C1 t-shirt
autographed by William Shatner (Captain Kirk of Star Trek)!

I thought the commie ran DD (180K) disks. At any rate, if they both look for track 0, sector 1, it would have to be on the same location as any other disk. Both systems use disk controllers that don't "know" what the OS is. You just tell the controller to find and read a sector and track. The sector number is imbedded in the ID field of the data. I suppose you could write two sets of boot sectors, one in DD and one in SD. If you read the wrong sectors, the retry would find the correct sector. May not work on a DD Atari drive, though. He will read the commie sectors OK.

Strangely, the referenced patent said track 16, which seems a little odd.

There are *bunches* of these, and most all work about the same, although the type of Dos you use can be important (e.g. Sparta vs. Dos II-types). APX had a good one called the "Diskette Librarian." It's available at www.atariarchives.org/APX. Or you can go to XL-Search at www.newbreedsoftware.com/xlsearch

You'll likely get lots of recommendations on your question.

693. Fixing an Atari - notes

Newsgroup: comp.sys.atari.8bit
Date: 2004-02-08 07:48:28 UTC
From: Ryan Underwood <nemesis@icequake.net>
Message-ID: <pan.2004.02.08.07.48.28.166361@icequake.net>
Source record: 17100

We just fixed a 800XL that was brought in out of mothballs and failed to do anything when powered on.

First, we noticed that the power supply was at 6V unloaded, and when attached to the machine and switched on, the output dropped to 3V. Well, either a bad supply or shorted chip somewhere. We powered off and removed ANTIC, GTIA, CPU, and PIA one by one, and each time re-checked the voltage when switched on. The voltage was nearly at 5V with all of the main chips out, and when each was put back in, the powered-on voltage steadily decreased to 3V. So it didn't look like any one chip was shorted (and thus sucking up all the current), so we guessed that the power supply was having trouble supplying current and causing the voltage to drop. Ordered a "new" power supply off ebay to replace the old one (the one with the choke box on the wire). Tested the new one, and a steady 5V when the machine was powered on and all chips in. Problem #1 solved.

Next part wasn't really a problem. We thought we were not getting any video output from the composite cable. Checked the wiring of the cable to make sure it was ok. Then followed a SAMS manual to verify voltages on various ICs. Suspected a diode at one point which we pulled and checked ok. We clipped the RF module's leads in case it was shorted and interfering with the display, with no results. Getting a little frustrated, we re-soldered the RF module pins and located a TV/Game switch to hookup to the TV. After hooking the Atari up through RF, we got video! Albeit fuzzy, and the colors were off. But that led us to check the connections with the composite cable. Sure enough, we had simply connected it wrong. All that troubleshooting for nothing! The video was still screwed up though, leading to the next Problem.

Problem #2 was that when the machine was powered on, it did not make it to the OS and the video was scrambled. We did the self-test (hold Option and power on) and noticed that the video was garbled here. I checked for shorted/hot RAM chips, and in the process pressed on a chip that made the display change dramatically. Made me suspicious, so we removed and reseated all 8 of the RAM chips. Powered back on, and "READY". Voila! Then we adjusted the color, and played lots of classic Atari games! :)

Just thought I would relate this in case it helps anyone else who pulls an Atari out of storage and it no longer works. It doesn't really make sense that the power supply would go bad just sitting there in storage, but that seems to be what has happened in our case.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

> I thought the commie ran DD (180K) disks.

No, it is single density with varying number of sectors, GCR encoding
and other nifty tricks to get 166K out of each disk side. The directory
is on physical (?) track 18, which may be a reason why it works. There
is a patent on the technology to mix disk formats which was referenced
in c.s.cbm the other day by the patent holder.

It is definitely possible. My parents had an old IBM clone, when I was in kindergarten I used to play a game "Learn Counting". 5 1/4" floppy that had software for IBM PC/clones, C64, Atari, and PET all on the one disk.

The same way you load and run it on a real Atari. You just have to
make sure you configure the emulator to utilize BASIC. After that,
just do a RUN D:PROGRAM.BAS

I have a few disk images I either downloaded or came with the emulator,
as follows:

DOS_20S.ATR (91KB)
DOS_25.ATR (131KB)
DOS_30.ATR (91KB)
DOS_40.ATR (91KB)
DOS_XE.ATR (91KB)

I guess these are what you're talking about. I hope the size doesn't
mean they're full. Now I guess I just have to find a way to load the
.bas files onto them.

706. APE Printing and Win XP

Newsgroup: comp.sys.atari.8bit
Date: 2004-02-09 12:51:02 UTC
From: llppwhite@aol.comnsp
Message-ID: <20040209075102.21850.00001342@mb-m22.aol.com>
Source record: 17113

I use APE quite a lot, but since I started using Win XP, I have no longer been able to print to my system printer through APE. I am aware that this XP printing issue affects at least two other APE users, so I'm not alone. The author of APE has made *many* program mods to help me, but it still persists. It works like this -- APE will start printing normally, but then stops before completion. It may print as little as a few lines, or may print a half-page, or occasionally even prints an entire listing of several pages. (But a few seconds later, may only print 5 lines or so.)
Incidently, SIO disk transfers are *no problem* -- even at 3X.

The easy work-around is to set up another printer, and I've done that, but due to space limitations, that means going to my garage every time I wan to print a program listing -- not very convenient. I also can make an ASCII listing and then import that into my PC text editor and print it out from the editor. On my previous system (1.3GHz Celeron Tualatin) I was able to set up a second partition with W98, but on my present XP system, W98 and ME "choke" on my hardware.

I'd be very interested in getting emails from users of APE and XP who either can or cannot print through APE to see if I can come up with some common denominator.
Thanks,
Larry

18/0 has to be there, but it can point to 16/0. There is no absolute
requirement that the actual directory is on track 18.

No, I understand that, but your post proves what I mean: the 1541 DOS cares
about track 18 to find its "mark" (not track 16).

Jason,
The Basic xe extension disk can be found in and downloaded from the
Holmes Utility archive on this website:
<ftp://atari8@atari.xs4all.nl/>. Use atari8 as the user name and
atari4ever as the password. There is a basic xl tool kit on the site
also that may be helpful. I have the basic XE manual so if you have
any questions on it's use you can send me an email and I will try to
answer them.

Regards,
kvan

Hi,

> Oh ok, how do I do that? Is there a way to create a blank disk image and
> drop the .BAS onto it or something?

Phew. Much to complicated. Probably you should get another emulator.
(Hint, hint).

On some emulators, you can setup a pseudo-handler that points to a directory
on the host operating system. Copy all the basic files there (suppose that
it's D:\Atari). Then tell the emulator that your files are in that
specific place. (On Atari++, it's in the menu under "OsRom" "H1Dir").

Turn off the automatic "option press" on reset so Basic remains enabled.
(The menu to the right).

The emulator should now boot up and show its "READY" message.

Then type:

RUN "H1:MYPROG.BAS"

where MYPROG.BAS is of course the name of the basic file on the local
machine in the local directory.

In case the program requires further data from floppy disk and thus
expects D: instead of H:, there's also a switch for that again in the
"OsROM" menu.

Greetings,
Thomas

720. SIO port debugging

Newsgroup: comp.sys.atari.8bit
Date: 2004-02-11 04:38:07 UTC
From: Slor <IDoNotLike@GreenEggsAnd.Spam>
Message-ID: <199532b3d78bd43b89b8b63048aa4e4c@news.teranews.com>
Source record: 17127

Hello all,

I'm hoping someone can help be quickly debug an issue with my Atari 800xl. I have my xl hooked up to a machine running Ape using the typical sio2pc cable. It ran great for a long time. However, It's been months since I used it, during which time my house actually took a direct lightning hit, and I recently turn the setup back on to find the sio2pc functionality no longer works. I'm guessing something got fried, even though none of the equipment was powered on during the storm. At any rate, I have verified that the serial port on my PC works fine, which means the issue is either in the Atari (which still runs fine in general) on in the sio2pc cable. I've opened the cable and see nothing to indicate surge-related damage, like a blown-up IC or diode, and I'm not sure how to go about further determining which side the issue is on. I don't actually still own any real SIO devices, so I don't have a really good way to test the port on the Atari, but perhaps one of you can tell me an easy way to rig something up? Something I can look at with a multimeter even if nothing is hooked up?

Anyway, any advice would be appreciated. I just got ahold of a "new old" PC to use as the APE slave, so I'm hoping I can just get a new cable and be back in business!

Thanks

>
> Thanks

Artur (j131) has been kind enough to offer to send me a new cable for testing. That's really nice, especially since I bought my original cable about a year and a half ago. Anyone who's looking at getting an SIO2PC cable should consider doing business with this guy.

Thanks Artur!

I have one of those Xetec Graphics AT printer interfaces that I haven't used in about 15 years. It's in good shape and free to anyone who wants to pay a couple bucks postage to get it there.

Bruce's DigiBarn is a great location for vintage computer folks who find themselves in the Bay Area.

Another great place is the Computer History Museum (www.computerhistory.org) in Mountain View, CA (about 20 miles from the DigiBarn, give or take) which has the largest collection of computer related artifacts in the world.

The 1st club Microwave promotion...

We stood in front of LA clubs passing out flyers to Microwave...

[snip]

http://www.clubmicrowave.com

Worlds 1st micromusic based dance club!

club MICROWAVE - Micromusic Dance Club Tuesday Nights @ The Echo in Silverlake, California

Opening Night: March 9th

MICROWAVE is the latest lo-fi dance sensation innovation from the good folks over at micromusic.net! Microwave is the 1st club in the world that caters to the chiptune or micromusic scene! Now, for the 1st time ever, people will be able to come and dance to all their favorite micro-hits! Oh, and not only will our DJ's be spinning all the latest and greatest titles from the micromusic/lo-fi and the best of their relative genres (like Elektro-Clash, 80's, IDM, Electronica, Breaks and more!), but we'll also have the seemingly endless roster of micro-artists from around the globe attending Microwave to deliver the goods in the flesh! That's right, every Microwave will have a special live musical performance by micro-artists from all over the globe! The fun begins March 9th 2004 @ 9pm at The Echo club in Silverlake!

What if you don't know if you like micromusic or chiptunes? DO NOT FEAR! We've got you covered! We know you are a dynamic individual with needs, so we will also be blending in the following genres to ease your transition into full-fledged micro-fan: Elektro-Clash, 80's, IDM, Electronica, Breaks and more!

Live Music performed by: BitShifter (NYC) Gameboy Micro Master vs. 8-Bit Weapon (Stickchick-Gameboy soloist, Omichord Rocker, & Drummer. Together with Naughtyboy - C64 SID Maverick) (LA)

DJ's: Shey (Break Beat, Micromusic, & Elektro), Mike Haggar (IDM & Micromusic), and Naughtyboy (80's Electronics, Micromusic, & Electro Clash)

Where is Microwave located?

Microwave will be held at The Echo in Silverlake.

The Echo
1822 W Sunset Blvd
Los Angeles, CA 90026-3227.
Phone (213) 413 8200

What is "micromusic.net"?

Micromusic.net is an international hub for people that love and/or
make videogame style music (www.micromusic.net). To get a better
sense of the type of sound this genre has, try to remember what
your favorite classic videogame sounded like, but add a healthy
dose of modern melodies and beats. Some common devices used to make
micromusic, or chiptunes, are Nintendo's GameBoy, Commodore 64
and/or Amiga computers, assorted Atari computers and/or consoles,
and any or all classic 8 bit computers and consoles...

For more information on Microwave or Micromusic in general feel
free to contact:

Seth D. Sternberger

727. artefacting on GTIA/CTIA

Newsgroup: comp.sys.atari.8bit
Date: 2004-02-12 09:58:39 UTC
From: Thomas Richter <thor@cleopatra.math.tu-berlin.de>
Message-ID: <c0fiofige1@mamenchi.zrz.TU-Berlin.DE>
Source record: 17134

Hi folks,

the issue is about finding reliable sources about how the typical GTIA/CTIA color artefacts look like on NTSC machines. (Artefacts = what you see if you draw an on/off pixel pattern in HIRES, caused by the limited bandwidth of the color carrier since here one pixel is only half a color clock wide).

Owning only a PAL Atari, I've no luck reproducing them here at home, so I'm seeking your help.

i) Artefacts on black/white screens. If I'm drawing the mentioned pattern with white lines on black background, what is the closest "standard" color in the Atari palette that approximates the artefact for

a) on-off patterns (i.e. even pixels white, odd pixels black)
b) off-on patterns (i.e. odd pixels white, even pixels black)

ii) Which colors would I get with a CTIA instead of a GTIA for the above configurations? (a) on-off, (b) off-on

iii) Consider I reverse now black and white, i.e. I'm drawing black lines on a white background. Do I get the reversed artefacts? In other words, if I'm drawing all even lines black, do I get the same "pseudo" color as if I'd draw the odd lines white on a black background (seems pretty logical to me, though!)

iv) Consider now that I'm not using a black background, but rather use a color for it, i.e. I draw artefacts on (say) a green background: Light green lines on a dark green screen. Which colors do you see? Are they identical to the colors in a) and b), or do you get different colors since the background color is different?

v) Consider I'm now altering the patterns. I'm drawing one horizontal line on-off patterns, and on the line below I draw off-on patterns. (Thus, a checkerboard alignment of white pixels on a black background). Which kind of colors do I get on NTSC? Do I get *additional* colors different from i), or do I just get two lines of different colors? (I assume the latter, though this would be not the case for the PAL color system that alters the color encoding each other line)

Well, please try and experiment a little, this would be very helpful for me. It would be extremly helpful if someone with a digital camera could make some pictures from a real NTSC TV showing the mentioned artefacts. As said, as a pure (poor?) PAL user I've no idea how this should look like.

If that helps, I'm willing to write a tiny Basic program that generates the mentioned patterns to aid volunteers. (-;

Thanks again,
Thomas

Hi, I'm Ben Smith, proprietor of Bravo Sierra Computers! I'm an Atari Dealer/Reseller who occupies a unique niche in the Atari World! Most Atari Dealers stick to just selling NEW, I also sell Used/2nd Hand Atari Goods! So not only do I sell NEW Atari Goods at a competitive price, I also sell used Atari Goods you may not be able to find anymore at Swap Meets, Thrift Stores or even Auctions Sites! And I sell for less! And unlike those who will remain anonymous! I test Goods before I sell them. So not only can I sell you some Great New stuff! But I can sell you hard to find 2nd Hand Goods, partly because I'm the guy most people come to when they want to give their Ataris a New Home! I'm saving Orphaned Atari's from Oblivion! Goto http://BensCatalogs.Atari.org or Call (503)256-9974! I'm not asking a lot, I'm just trying to make a living and I'd like to earn your Business!

Source record: 17142

From your description, the memory cards are how they should be for a late model Atari 800.

From what I remembered, the early ones had plastic cases on the ROM and RAM modules, and had two thumb tabs to remove the cover to access the modules. Later model 800s had 48K standard, and to improve cooling Atari installed them without the cases but put a small plastic strip across the tops of the cards to hold them in position. These machines also lost the thumb tabs and have regular screws to secure the cover over the memory slots. If this is the case with your machine, nothing is wrong, you've just got a later model.

I had, some years back, a disk mag that supplied one cover disk that could be read on three machines; Amiga, Atari ST & PC.

> have the same radial location, the other system's sectors would probably
> be "invisible". All it would take is a few boot sectors, then forcing

Yes, each machine could only read its own stuff. Made a 1 Meg floppy look like 333k.

> each system to different tracks on the disk. But still, that's a really
> neat trick! Larry

True, but it could take ages for the machines to get to grips with the custom sectoring.

Atari and St low density (720kl) disks are compatible anyway. I doubt
it's possible to make a disk that Pc/atari's could read work on the
amiga without special driver for the amiga to read pc disks, since
Amiga's drive's work so differently from the pc's.

Yes, it was very well appreciated! I did some browsing, and see
now, what the "cased" 16K boards look like. Cool.

It means you have two choices, both bad. One is not so bad as the other
and is said to be 'the lesser of two evils' i.e. the least bad of two bad
choices.

His quote was:

>> Thanks for that particularly fine shaving of lesser known info,

Lesser known info - not lesser of two evils

"Lesser of two evils", would refer to the one of two evil
entities, which was less evil than the other.

As it turns out, I have 3 16K memory cards.

2 are in plastic cases, and 1 is a "48K expansion"
option, which seems to just be a card wrapped in bubble
wrap, in a much different retail box. (Just black
and white, as opposed to the colorful boxes of the
other 2)

Gotta love that old artwork of the 80s!

748. Atari 800 keyboard problems

Newsgroup: comp.sys.atari.8bit

Hi Folks,

Much to my disappointment, the 800 I just hooked up,
which has been stored away for years, is experiencing
keyboard problems. Some keys require a hard press, and
others do not react at all.

Is there a known procudure I can follow to "restore" them?

Many Thanks,

John

Well,
the first half of the disk (boot sectors and data sectors) is reserved
for the A8, the second half (no boot sectors - only data sectors) is
reserved for the C64. It is very easy to copy such a disk, take a sector
copier and read the disk, when errors appear, ignore them (these are the
C64 datas) and write back only the good sectors. Afaik none of these
hybrid disks were copy protected in any way...
greetings, Andreas.

Er well,
artifacting also works on PAL machines (but differs from NTSC machines).
Otherwise said, if you use artifacting on NTSC machines, it will only
work good on NTSC, if you use it on PAL machines, it will only work good
on PAL. To find out how artifacting on PAL works, refer to british New
Atari User issue 53 or 63 (??? not sure which one it was) and read a
nice article about it and test some included demo software (a basic
program)... greetings, Andreas.

Slor schrieb:

After reading up on the Freddie chip and the notes in the FAQ, I was wondering if anyone has upgraded the MMU chips and added a 2nd bank of 64K chips to the 800XL to get 100% 130XE compatability. (I don't mean making an 800XL-F, but instead using the 130XE MMU chip).

Friday the 13th strikes again, with the 2 Atari 400
computers I just ook out of storage also. I need to
repair these, and would welcome any advise, however
brief, from anyone who has done this.

I will probably dive in myself tonight, but I'm hoping
someone "in the know" sees this post first.

Many thanks for any and all info,

John

I have seen something like this that I can remember. All my disks
that have both versions have one on one side and one on the other.
Maybe someone found some way to accomplish this, but I cannot see
how it could be done.

You might try prying off the key pads, one at a time, to see if you need
to clean up any accumulated grime or corrosion.

Subject: Introduction

Conventions

All commercial vendors, developers, publishers, and repair shops should be listed here. "Active" PD/freeware/shareware developers should also be listed. Persons or entities holding rights to products, but not selling or supporting them in any way, should NOT be listed here.

"Vendor" = Reseller of products produced by others. Types of products sold are given in categories: new hardware, used hardware, PD/freeware/shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the developer are listed. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices.

"Repair Shop" = Can repair 8-bit Atari or related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given

heading. "See also" references indicate closely-related information may
be found under the given heading.

No email addresses are listed due to spam consequences.

SAE/SASE/IRC info from http://www.genfair.com/greenpages/sae.htm
---
It is courteous when writing to any new correspondent to cover in advance
their postage costs in replying to you. If they are in the same country it's a
simple matter to enclose an SAE (stamped addressed envelope), which is known
in American English as an SASE (self-addressed stamped envelope). It is not
always obvious how to do this for correspondents in another country. One
answer is to use International Reply Coupons.

An International Reply Coupon can be purchased at any Post Office in any
country in the world. This is agreed through the Universal Postal Union. You
can then send the IRC to someone in another country who can cash it in at a
Post Office there for a postage stamp covering the minimum rate for an Airmail
letter (unregistered).

One IRC enables a letter up to 10 grammes to be airmailed abroad. That's not
much more than a couple of sheets of paper. So if you want a reply with more
than this, better send two or more IRCs!

Verfications -> YOU!

This list is in a constant state of development, and comes with no
guarantees. Information of this nature constantly ages; therefore, the
information contained in this list is constantly updated. Please use the
latest release of this list whenever possible!

Remember, the success of this list is dependent on YOU, the reader, to
send me updates that correct errors that you find. If you use this
list, please do your part in keeping it useful for everyone!

Hi,

Does anyone have a pic of the original power supply,
or even know if says "Indus" on it anywhere? I just
opened up the box for mine, and the power supply was
not there.

I've had several Indus, and they all came with a PS labeled "DATABYTE" on the top. They are labeled (bottom) 11.5V at 1.95A, plus the UL logo, etc. (FWIW)
An Atari 5200 DC PS apparently works ok, but the Indus repair manual says that an unloaded Indus PS should put out between 12.2 and 13.0 VDC.

Hi,

Wow, I'm having some retro-fun with my 8-bit stuff, but
I found I am in need of plotter pens. Has anyone ever
tried to refill them with ink such as that from a ball pen?

Or, any other suggestions?

Thanks, John

media@cgexpo.com

CGE SERVICES CORPORATION ANNOUNCES SHOW DATES AND NEW LOCATION FOR CLASSIC GAMING EXPO 2004

Classic Gaming Expo Has Outgrown Its Home

VALLEY STREAM, NEW YORK - February 12, 2004- The organizers of Classic Gaming Expo announced today that the 2004 Classic Gaming Expo will be held August 21 and 22 at the San Jose Convention Center in San Jose, California. Citing ever-growing attendance, the organizers were compelled to seek larger quarters for their seventh annual event; the video gaming industry's largest show dedicated to the preservation and celebration of video game history.

"We're very excited about the show's move to the heart of the video game industry," said John Hardie, co-founder of CGE Services Corporation. "Las Vegas has been very good to us, but over the past couple of years attendance has risen to the point that it was getting a little crowded there. We also felt that since many of our alumni and sponsors were located on the West Coast, not to mention a larger collector base and game press, it would be more convenient and comfortable for everyone if the show was relocated to California."

According to Hardie, this year's Classic Gaming Expo will utilize more than 30,000 square feet of exhibit space in the San Jose Convention Center. The main show floor will see an increase of over 7,000 square feet while the keynote speaker room and museum of gaming history will double in size.

In 2003 over 1400 people attended Classic Gaming Expo to see the latest offerings from the various exhibitors, visit the world's most comprehensive video game museum, play classic and modern games, and meet

the luminaries of video gaming's past and present. In the history of the show such notable personalities as Nolan Bushnell, Ralph Baer, Jay Smith, David Crane and hundreds of other celebrities have attended and spoken to the attendees. Show co-organizers John Hardie, Sean Kelly and Joe Santulli expect the move to San Jose to further increase attendance and bring more industry pioneers to the show.

Moving the show to California is something we've considered for the past couple of years but finding a suitable location and making arrangements to move and store our vast archive of material has taken a great deal of time and effort," said Hardie. "We look forward to the continued support of our past patrons as well as the new friends we'll make in California."

Classic Gaming Expo is open to anyone with an interest in video games - both classic and modern. Information on attendance, ticketing and past events is available at www.cgexpo.com.

About CGE Services Corporation

Classic Gaming Expo is a production of CGE Services Corporation. Currently in its seventh year, Classic Gaming Expo remains the industry's only annual event dedicated to celebrating and preserving the history of electronic entertainment, bringing together industry pioneers, gaming enthusiasts and the media for the ultimate experience in learning, game-playing and networking. For additional information, visit CGE Services Corporation's Web site at http://www.cgexpo.com.

Not according to any retro mags sold here, all they cover is the Spectrum and the C64.

Hell, they even promote half the games as being only on those machines. Ok, maybe the Atari never had the vast fan base that those machines did but they were hardly unknowns. What with Atari User (my old lot), Page 6, Monitor as mags and shops such as Silica & Maplin (again, my old lot) making a good living from the Atari I just can't understand how under researched these bloody magazines are!

I do allow that most of the er 'writers' are not old enough to wipe their own ar*** but at least bother to do the time to cover what was out there in the UK when you release a magazine called Retro Gamer, the best they could manage was a reprint of an advert for an 800 with a whinge about how expensive it was.

Yes it was expensive but they sold and sold well...I should know!!!

And don't get me started on the idiot writers that do the history of a game and forget to mention where it came from originally, according to them all software was developed on the Spectrum and C64, machines like Apples, Atari's and BBC's were barren machines that only had type in listings.

And the last rant, not only did Retro Gamer basically dribble on about all things Sinclair and Commodore (both excellent game filled machines mind) but the magazine was hardly jam packed for the hefty 6.00UK price tag which is VERY expensive for a magazine here. To be fair i didn't mention the fantastic free gift (lol) on the front, they gave a CD full of remakes & emulators, yup a CD full of software of which I doubt anyone was contacted to check if it was ok to publish their works for profit (well 6UK for a mag with a CD on is at least 1.50UK above mags with a DVD on) and a CD containing emulators of which many were totally useless as they needed copyrighted roms to even fire them up.

I know I seem to be hating this magazine but I don't, I just can't stand half arsed work. If you make a magazine or include articles about retro computers then bother to do it properly.

<stuff clipped>

I'm from the USA and one of the great things about the British Amiga magazines that made their way over here was that they were a great value, loads of content and cover disks. There was one humorous letter to the editor of Amiga Format IIRC that said "how come our US Amiga mags are comparatively expensive" and the response from the UK editor was "we reckon those guys overcharge." Ahaha!

I am surprised to hear that this new retro mag is neglecting the Atari 8bit. There were a lot of UK cassette-based games like Llamatron for the Atari 8bit, I obtained a few, so even over here I know the UK Atari 8bit scene was happening.

You might try a letter to the editors of Retro Gamer. Sometimes with small time magazines you can get results that way.

Yup :-)

I must say that when a UK mag gets it right they can be one of the
best reads anywhere.

It amazes me that they just forgot the likes of Archer Mclean, he's a
legend in the gaming circles and started out commercially on the
Atari, Dropzone is still one of the finest Defender clones out there
(ok Archer, it wasn't a clone ;-))

Adam Michael Billyard, he wrote Bellum, Chop suey, Elektraglide, Jeff
minter as you said and countless others who made games that sold very
very well.

>You might try a letter to the editors of Retro Gamer. Sometimes with

Indeed. I was an avid fan of "The One". I loved the layout with the text under screenshots explaining parts of the games where the article text only stated the basic facts. Actually, if I was to name _one_ most favourite games magazine of all time, it'd be The One.

Other mags I got from the UK were C+VG and some other which name I forgot. I bought that one after The One was discontinued. And they were EX-PEN-SIVE here in Germany! Subscription prices were the same as buying them at the international book store (which are mostly located at train stations in Germany, don't ask me why - and airports of course) so I never subscribed.

Regards,
Thomas

your message brings to mind a few questions. I bought and downloaded
a lot of euro software for my amiga in the 90's, since that machine
was more popular overseas. One thing I wasn't aware of, was that the
atari 8-bit which pretty much died in the water in the late 80's was
still having some success in Europe. I always assumed the reason the
software from europe wasn't trickling over here the way Amiga software
did was due to the NTSC/PAL thing. The Amiga was designed so you
could switch easily to either mode, but of course the Atari could not
do this. I recently downloaded many demo's and some games from the
90's for the 8bit and they floor me (3d texture maps?? hi res
platformers, etc..) but to run properly I must put my emulated atari
in PAL mode.

How were the pal games played on NTSC machines?

Well, the Atari wasn't like that but the BBC...? [tries not to snigger =-]
Nah, kidding. i agree with you that the mag was flawed but, considering
that most publishers seemed more than a little dubious when the idea was
floated previously, it's nice that someone actually took the risk of a full
magazine dedicated to "retro" machines. Other people have had responses
from the editor, but not quick ones - although it seems that the sales have
justified the publishers going bi-monthly with it so there must have been
some feedback.

This is the one thing I always lamented about the Ataris.. over here in the states it seems like while some arcade games were converted, it was only the super duper blockbusters. In Europe in general and the UK in particular, those guys would convert ANYTHING to ANYTHING. For crying out loud they had Afterburner on the Spectrum.. LOL. Now I'm sure some of them were crap, but I played a version of Rush n Attack on a Spectrum emulator that wasn't too bad. I really liked a game by Universal Electronics called "LadyBug".. but about the only platform over here you could get it on is the ColecoVision.

But.. just when you thought it was over you've got Sheddy over there with a damned nice Space Harrier conversion to the Atari 8-bit.

Hello John, best bet is to buy a replacment keyboard but in case you
are interested, Dan's OSS cart page has a procedure to "fix" a
keyboard for a 1200xl which was similar to my 800. Both have carbon
pads on a mylar sheet making contact with a printed circuit board.
The site is at...http://retrobits.net/

> Atari User issue 53 or 63 (??? not sure which one it was) and read a
> nice article about it and test some included demo software (a basic
> program)... greetings, Andreas.

Well, it works "in some sense". The point is that on NTSC, the GTIA color clock is just the system clock and thus the pixel clock. This is not the case on PAL. Here the color clock is 5/4th of the system clock - there's actually an additional circuit on PAL Ataris to generate this clock (a divide-by-four counter with two 7474 flipflops and an oscillator running on the fifth overtone). Thus, you can draw "kinna like" artifacts on PAL by drawing a five-forth pattern in HIRES (draw every other line like in NTSC, but leave one blank after four lines, then alter the pattern).

The overall effect is not very visible, though. What I get here is grey that looks a bit greenish, and a grey that looks possibly a bit blue-ish, but no remarkable color artifacts.

It is interesting to note, though, that PAL provides other display artifacts that are not possible on NTSC, though. At least, I doubt you can observe them on NTSC, that is. I haven't tried. PAL changes the phase of the color modulation every other line, and the TV is supposed to correct that, then mixes to adjacent lines to correct/compensate for a phase shift that happens in the transmission - to avoid the typical NTSC color shifts ("never the same color"). This leads to the effect that the TV actually mixes colors in adjacent rows (not colors!) if their luminance is similar.

Try this: Open a GR.11 screen in basic, then draw horizontal lines, even lines in red, odd lines in blue. What you get is pink and *no* observable stripes at all. (PAL artifacts. Actually, Atari++ can emulate these!)

Now open a GR.15 screen, do the same again, and set the luminance of red to the luminance of blue. Again, no visible lines. Now change the luminance of blue: You get the lines back!

This effect can be used for "Hires"-artefacts in a similar way, though the result is different. Draw on-off-on-off-off patterns in one line, and shift the pattern in the line below. With that, you get two additional "pseudo-colors" in PAL. The color is not very intense and looks more like grey stripes with a "taint of a color", but what I get this way is another

color that looks "kinna like" pink and "kinna like" green-ish.

How this looks on NTSC I don't know. I wouldn't expect additional colors as I see them on PAL (there is no 180 degree phase shift every other line in the color modulation), but maybe other things can be observed this way.

So long,
Thomas

Well, it's an array of CHARACTERS, not of STRINGS, though ;)

It's like in C:

char x[100];

That's a _string_ of up to 100 characters. (Well, 99, cuz you have to include
the NUL terminator at the end.) But I don't think anyone would call it
a "string array". That'd be this:

char strs[10][100];

It's really a multidimensional array of char's, but can be thought of as
an array of 10 strings, each up to 99 characters long.

Tough one. :^) Zybex and Draconus look good, if a little monotone sometimes ;)

Rescue on Fractalus, Koronis Rift and The Eidolon are great looking 3D games.
(I want to learn how to do the really fast 3D graphics they use, damnit!)

Alternate Reality the City is one of the most colorful games I've ever seen.

MegaBlast has about the most objects I've seen flying around and exploding
on the screen at once.

Best-looking up-and-comer is the clone of Space Harrier. *drool*

How's that comin', anyway!?

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

I think the Atari did have a problem over here in the UK, and a seriously hard up-hill struggle. Initialy expensive, and later competing directly in price with the BBC sponsered Acorn BBC Micro computers that were pushed by a government education program into all schools. This ment a serious dilution of its target market, or at least those who could afford it, where divided between a machine associated with games, and a machine associated with education (and supported by Auntie beeb). As it was normaly parents that held the purse strings, education won out.

Later the Amstrad CPC range could be seen as the Atari's main rival. A late arrival that did well here in the UK. Most games on the Atari were also on the C=64, and the Spectrum had its own legion of home coders and games makers. And there was a large number of conversions and ports going on.
Those like me, whose parents purses would not afford a BBC or a even a Commodore had to make do with the much cheeper Spectrum, which was for all its faults a competent machine. The Spectrum was 'Good enough' to catch on, and comercial inertia did the rest. It still wasnt an atari 800 with a Star Raiders cart though ;0)

Think about it, 82/83/84 it was approx 100ï¿½ for a spectrum, approx 200ï¿½ for a C=64, approx ï¿½300 for an Atari 800/800XL or a BBC Micro. With apparently not much technicly or capability wise between the C=64 and the Atari 800XL it took the Dixons deals of 85 onwards to push the Atari into serious competing position (which was when, with my first pay packet i finaly got my 800xl and Star Raiders!).

The Upshot was that the Spectrum And C=64 ruled when it came to gaming through shere numbers of systems out there. They are, alas, the machines most remembered, even if the Spectrum cannot actualy compete with the Atari, and the C=64 which effectivly stole every good thing the Atari 400/800 range offerd 3 years before it hit the shelves!

Back to the magazine, yes the Cover CD was rather lacking as well, as a 'retro gamer' myself i would have prefered more freeware PC conversions/re-workings, and a wider variety (how many tetris versions do you need FFS!) or updated supplemented with MP3s of legitimately available tape images, or .cas and .tzx images and format to .wav software.

For those scratching their heads take a look here:-
http://www.livepublishing.co.uk/content/retro.shtml
There is actualy a Bulliten board attached which you can give feed back via. I count 2 other fellow Atari 8-bit users already there making a fuss and asking for support/recognition of 'not-the-usual-suspects'. ;0)

I used to live near Maplins in Southend and my impression was very
different. Initially I knew people who either went for ZX81's or Vic 20s
or Atari's. Most people I knew had Atari's because of Maplins. I actually
knew around 6-7 Atari users versus 1 ZX, 1 Vic and a BBC B. Later I'd say
the competition was the C64.

> Think about it, 82/83/84 it was approx 100 for a spectrum, approx
> 200 for a C=64, approx 300 for an Atari 800/800XL or a BBC Micro.
I knew one person who went from a PET to a BBC B but that apart the choice
seemed to be 100 for a Sinclair of some vintage or 300+ for the Atari.
C64 users were viewed as johnny come lately's ('is that your first
computer? I've had my Atari for 3 years mate!') My first machine was a 32K
400 from Maplins (350?) an 810 (350) 410 (50) totalling 750. My anual
salary was 1978pa at the time (before tax) so that was an insane purchase
in hindsite. Who'd spendc half their salary on a PC?!?

> With apparently not much technicly or capability wise between the C=64
> and the Atari 800XL it took the Dixons deals of 85 onwards to push the
> Atari into serious competing position (which was when, with my first
> pay packet i finaly got my 800xl and Star Raiders!).
Agreed. Dixons did wonders for market penetration but TBH, I'd got bored
by then. The good years for me were 81-83. The machines were untouchable
compared to the competition, flyers and info about stuff like the 1450XLD
had me drooling and their were all kinds of funky addons like graphics
tablets, printer interfaces that meant you didn't have to have an Atari
printer (epson!) and stuff like Broderbunds Print Shop (such power!). The
first time I saw the see-through ghosts in Jawbreaker I nearly wet myself.
Having grown up on the 2600 and Binatone tennis games, that looked
unbelievable. Surely GFX couldn't get better than that?

The main reasons it has not sold to well is:

1. The cost.

2. Find a shop that has it.

in my area West London no WH Smiths
had it in stock, but WH Smiths in Kingston
had copies, not seen it in any other shop.

Hi Paul,

> Had a play of this and basically its Archon / Archon 2 updated, fans

Very interesting...I was a huge Archon fan back in the day. I'm surprised no one has really made a modern update to it...or is there one out there?

The Lucas Arts version reminds me more of Tekken or Killer Instinct. It doesn't really seem like the type of game that Lucas Arts would make...more Japanese.

Hehe... Looking at the disassembled code wouldn't help me too much.
I just want to learn the /technique/, to possibly use in C.

But thx. :^)

Atari 2600 with 4 unopened MINT games, 4 used games, joysticks and
More.
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3078966636

Okay, I know this is the 8-bit Newsgroup, but before you flame me for
posting this 2600 Auction, please let me explain.

I am auctioning off some of the Atari things I no longer use or have
duplicates of, so I can pay for an inital production of the Atari 8bit
Ethernet Cartridge. More info here:
http://home.comcast.net/~atariguy1/atari/a8ether/index.html

I have fixed the packet dropping issues, and have updated the
software. It is working well, but the new web browser is currently
too big for memory...working on this.

Anyway, check out the auction and the website.

Thanks,
Chris

803. How DOES Rescue on Fractalus work?

Newsgroup: comp.sys.atari.8bit
Date: 2004-02-17 08:25:17 UTC
From: bill@newbreedsoftware.com
Message-ID: <NdkYb.1787$_3.29303@typhoon.sonic.net>
Source record: 17010

Are there any good articles on the graphics methods used in games like
Rescue on Fractulus and Koronis Rift? I was thinking about it since
posting in the 'Best Game?' thread yesterday...

At a Linux user group meeting tonight some folks from
Z-World/Rabbit Semiconductor, who produce 8-bit processors based on Z80 which
can do TCP/IP, SSL, webserving, etc., came to talk about SSL in general.

At dinner after the meeting, I was talking with a friend who did some
6502 coding for consumer toys recently, and tried to explain what
Rescue on Fractulus looked like. So, after dinner, I made him come to my
house and fired it up on an emulator, to see if he had any ideas how it
might work.

I can tell, with a fair bit of confidence, that the 3D terrain stuff isn't
using any Atari-specific 'tricks' (like DLIs and Player/Missile Graphics).
Obviously, it's some kind of fractal code... but I'd love to learn more
about it. :^)

Anyone got any references they want to share? :)

Domesday not Doomday. It's a BBC B with a custom laserdisc player
designed in the eighties to output the results of a UK wide survey. Now
very rare as they cost several thousands of pounds and were aimed at
schools and libraries.

I know what you mean, the cost was prohibitive!

Kingston (SW London) is where I Lived at the time. Back in 82 i
remember there was one shop in Judges mall (behind the Marks and
Sparks) that Had an 800 in display (and a Dragon 64, a vetrex and
every other then available machine) but that shut sometime in 83 (I
know as i had to go to the croyden main shop to get my speccy fixed).
Bentals department store had them as well (this is pre Bentals centre,
and it always had star raiders running!) and a computer specialist
oppisite The Hawker factory had them as well. Despite this, I only
knew of one person who had an Atari 800 and that was the brother of
one of my school mates. The Local Tiffin Girls school has some as well
(as i discovered on one of their open days).

As i said earlier i didn't actualy get one untill 1985 with my first
pay packet.

Software wise i had good luck with Silica shop (lion house in london),
The Market in Epsom had a great computer stall, There was a Place in
Great Yarmouth that i raided for games every time i visited my
Grandparents that had cheep old carts. I did make it down to the main
oprington silica shop a couple of times (buying a 1050 for on thing).
But it really was a hunt, i suppose more fun because of it, but still
a hunt and i never felt confident of saying 'i'm going out to get X or
Y game, and be sure i would actualy find it!

You are correct.
did you know there was an atari service bulletine that required the removel of the plastic cases from the memory boards because they were getting too hot. these little suckers had 3 voltages on them from memory, +12, +5 and -5 volts. it is what the memory chips of the time required.

Does anyone have a synassembler cartridge photograph or ROM image they could post? I haven't seen one for sale since I've been looking for a while.

I used to own that 8 bit cartridge and lost it over the years gone by. It was (if I recall correctly) translucent red, absolutely cool looking. I actually had a copy that was modified by synapse to run on the 1200XL I had at the time. I bought the cartridge, then it wouldnt run on my 1200xl, then I returned it to the store, who then returned to to synapse, who sent me a new cartridge. Talk about rare, probably, eh?

I used to own the synassembler cartridge, but alas I lost it over the years gone by. I remember it being a beautiful transparent red color. Does anyone have a digital photograph of the cartridge they could upload or even a ROM image?

Incidently, I used to own a 1200XL version of the cartridge, which was probably pretty darn rare. I remember that I bought the cartridge, but it didn't work on my shiny new 1200XL, so it got returned to the store, who wouldn't give me a refund, but did return the cartridge to Synapse for me for a working copy, which they modified or came out with a new 1200XL working version. Wish I still had it!

And let's be completely honest; the Atari 8-bit isn't a bad range, and
has nice custom hardware, but for overall versatility, the BBC B range
kicks it's arse. As it should, given that the Atari was designed in
1979, and the BBC in '81.

Richard (the only machine more versatile than a BBC (without going to
really esoteric stuff) is an Apple][).

And, for that matter, I don't have a pet fox. It's a cat ;)

Domesday machines are rather more than just a BBC B with a laserdisc
player - they're a BBC Master AIV (a BBC Master 128, plus 4Mhz CMOS
Turbo co-processor, plus Acorn SCSI card - Acorn were sticking SCSI on
8-bit computers in 1984, in the ABC, and at least part of that project
survived ;)). Special filing system, and some neat BCPL based software.

There is also a PCish compatible version, where the LD player
communicated via RS232 and could be used with a Research Machines Nimbus
(80186) based system.

Cost ï¿½4,000 in 1986. They are, however, astonishingly good for their
age.

Richard

hmm... It appears that the keyboard(s) in the 400 computers were not the main issue. I swapped the keyboard, and the same keys would not work. I swapped many boards, and between 2 computers, I could not make one working 400. Although "memopad" on one allows all keys to react, if a cartridge is put in, the machine just freezes, with the screen displaying "wierdness".

I'm going to try to reseat all the chips on the boards to see of that varies the results.

> to learn more about it. :^)

I remember an interview with Noah Falstein in an issue of German "Happy Computer" issue where he said something to the account that the fractals in Koronis Rift and Rescue On Fractalus were "faked" in some way... They look like fractal graphics, but since the machines are so slow the algorithms behind it aren't real fractal mathematics.

But...

http://www.qlam.com/atari/s_rescue.html says:
"I was office mates with fractal wizard Loren Carpenter, the man who was largely responsible for the fractal mountains in "the Genesis Effect" in Star Trek 2. We talked about whether there might be a way to do fractals on an Atari 800... Loren thought about it, said yes, and proved it by borrowing an Atari and banging out code for the next several weeks at home."

http://www.dadgum.com/halcyon/BOOK/FOX.HTM says:
"I asked Loren if it would be possible to use a simplified form of fractals on an Atari 800. Loving a challenge, Loren spent some time thinking about this and decided to give it a shot. We gave him an Atari 800 to take home and, in the next several weeks, he learned 6502 assembly language and the hardware specifics of the Atari 800 and came back with a working demo of fractal-based terrain running at an acceptable frame rate."

Also very interesting:

It depends on what you mean by faked. The fractals in those early
atari 800 computers just weren't calculated in real time, but they are
still fractals.

Awesome game, I still remember the first time an Alien lept out at me. I
get the same effect from the Face Huggers in Aliens V Predator on the
Jag. Star Raiders is still the greatest tho.

I didn't care for it either until I figured out how to play. Keep in mind this was back in the day when there was no Internet and I had to figure it out for myself.

Not to mention the ink roller cartridge, good luck finding one of them!
It's a nice, fast printer but it has too many obsolete parts to be anything
but a collectable.

The Lucas arts game is very Archon in it's feel, the fighting is a
little more advanced but the concept is pure Archon.

As someone else said there's been a purists remake coming for some
time now but its so looooong I have nearly given up on it.

C&VG has become something of a joke these days, the reviews are a mish
mash of nonsense and the style is just so 'surf dude'. The only mags I
get these days are GamesTM and Edge, GamesTM feels like 'The One'
reborn...

Anything else is either poorly written, badly researched or a
combination of both.

Yup, lots of semi useless emulators could have been converted into the
HUGE database of retro remakes out there and tributes in one form or
another. If something does not work straight from the disk then its
less useful than something that does..

Obviously being ex Maplin and hired to sell the Atari's in the first
place could make me rather one sided here but I have to say I myself
was a user of all of these machines but my two faves were the Atari
then the C64. Most of the folk I knew were Atari guys initially and
later switched to the C64 when the market fell out for the Atari.

These people had free choice of the machines out there and chose the
Atari on merit ignoring the rather prohibitive pricing.

The print head is still probably fine, just the character strip that
fell apart. It attaches easily "afair".

The ink roller is replaceable..several brands of common calculators use
a similar diameter, but the length needs to be cut down.

Rick D.

Well, yeah, but can you plug an 80286, Western 32016, ARM (32-bit) or
whatever into your Atari? Thought not ;)

Ataris are very nice. They have about the same expansion as most 8-bits
had. Apple and Acorn produced machines which required less interfacing
or hassle to get more out of them; in Apple's case with provision for
sensible cards, in Acorn's case, by providing more interfaces than you
can shake an Enterprise 128 at.

Richard

> I returned it to the store, who then returned to to synapse, who sent me a new cartridge. Talk about rare,
probably, eh? <

I presume you mean the customer-friendly response. Synapse was very accomodating. I started my Atari life with an 800+cassette system in '82. Then I got a disk drive later in '82 and sent a note to Synapse to see if I could upgrade a couple of cassettes to disk versions (Protector and Claim Jumper). They sent me a note back to mail them in and they would exchange them for disks -- free.

Synapse used those translucent red carts for a lot of games, also. And with no fancy labels. You probably could find that cart shell as a game...

Larry

Yes, the "character strip" is what is in pieces, some just little
crumbs of mushy rubberish plastic. :(

SO, I do not have a complete one, and I can't even begin to
construct a diagram of that part.

I'm not sure what the condition of the "character strip" is in
your printer, but it seems they deteriorate over time. I'm
not giving up yet, on trying to construct another.

Well when you put together the high speed that it spins at, along with the
acids in the ink, combined with years of use and vibration. It's a miracle
these lasted 2 years, let alone 20 years!
My main printer is the Atari 1025 line printer. It uses standard typewriter
ribbons and is a heck of alot more reliable.
Mo

A bit in PORTB determines if Antic can 'see' the extended RAM at $4000. If
that bit is set, or clear, whichever required, then you have less RAM
available, eg. you only have 128k available on a 256k upgrade, like Newell.
Antic access to extended RAM seems like was only for 128k machines.
I wrote a program to load GR9 pics in the extended banks available. Seems
like there was room for 8 8k pictures.
Once loaded, the program would rotate through the pictures.

http://www.nleaudio.com/css/

I guess they are still in business?? However, according to the website, it
has not been updated since 2000!

849. Advice? - Using Atari 8bit as "print server"

Newsgroup: comp.sys.atari.8bit
Date: 2004-02-19 22:16:14 UTC
From: John Miskinis <nospam@here.com>
Message-ID: <pan.2004.02.19.22.16.14.189649@here.com>
Source record: 16956

Hi,

I've been trying to use an Atari 800XL system, with
850 interface, and one of (1020 or 1025) as a printer, as
a "print server".

It seems if I send "long lines" however, I lose
characters, and get "garbage". I'm wondering if anyone
else has done this, and/or knows where source code exists.

I wrote a small LINUX program, to open a text file, and
echo 1 line at a time, sleeping 10 seconds in between lines.
It echos the line to the serial port on the PC (/dev/ttyS0).

On the Atari 800XL, I open the "R1:" port, get characters
until end of line, close "R1:", and print them to the "P:" device, which
seems to work fine for short (< 40 or so) lines. I then loop
back to where the port is opened.

I am using a null modem of course, and not sure if I can
just enable the flow control properly on the 850, and that
will cure the character-loss issue.

Any information is appreciated...

Couple of questions come to mind. What's the baud rate of your connection ?
What language are you using on the Atari side ? For example, I don't imagine
native Basic can drive a 9600 baud connection without machine language
assists. My first guess is a speed issue.

Hi,

I've been using 1200 baud, and Atari BASIC. I will experiment
at 300 baud, and will also try a per-char delay on the sending
side.

If you want to check out the refilling option the website is:
<http://groups.google.com/groups?hl=en&group=comp.sys.atari.8bit>
In the search box type Alan Frazer then click on the cirle underneath
the box to search in comp.sys.atari.8bit. You should then be able to
find his post from March 14, 1997.

kvan

853. Three large lots of Atari 400 stuff - look, rare stuff!

Newsgroup: comp.sys.atari.8bit
Date: 2004-02-20 03:45:49 UTC
From: jt <jt@yahoo.com>
Message-ID: <190220042144566289%jt@yahoo.com>

Please excuse the spam, but I genuinely believe you guys will find this
interesting.

I have three large lots of Atari 400 stuff that just went up on Ebay.

These are big boxes with a ton of great stuff.
Descriptions follow.

Thanks for looking, and pardon the unsolicited email.

thanks

JT

Lot #1
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3079636683

Lot #2
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3079638646

Lot #3
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3079642706

Lot #1 includes the Atari 400 CPU, in the original box, with the
original packing materials, and the following Atari-made cartridges:

Super Breakout, Centepede, Computer Chess, Defender, Star Raiders,
Missile Command, Pole Position, Asteroids, Donkey Kong, plus third
party software carts from: Pool 400 (from IDSI), and K-Razy Shootout
(basically Berzerk) from K-Byte (I seem to remember problems booting
this one up).

The package also comes with a Wico Super joystick, two Atari joysticks,
a pair of paddle controllers (one of the is missing the top piece, see
pic).

That's not all, you get the original manuals for all of the games, and
the original boxes for three of them.

AND, you get the original box and packing materials plus the original
manual and the power supply.

It's ALL HERE!
Everything you need!

Lot#2 includes the Atari 410 Program Recorder with the original manual,
and four game tapes with their original manuals/paperwork.

The games are: Dodge Racer (Synapse - this game is super fun!), Galactic Chase (Spectrum - essentially Galaga), Crossfire (by Jay Sullivan, On-Line systems), Shost Hunter (Arcade Plus, essentially Pac-Man).

This lot is in great shape. I sure hope someone ports these games over to an Emulator... who knows, these may be the last surviving copies anywhere of these old games!

Lot #3 includes the original "The Programmer" accessory set in its original box. This includes the Atari BASIC cartridge, the 330-page Atari BASIC A Self Teaching Guide (by Albrecht, Finkel, and Brown), and the Atari 400/800 Basic Reference Manual. The lot also includes a big pile of additional programming references:

101 Atari Computer Tips and Tricks by Alan North (130 p.)

Atari Games and Recreations by Kohl, Kahn, Cleland, and Linsday (340 pages, hardback, and featuring a hep cartoon space alien bug as your guide).

Atari Personal Computer Operations Summary guide 55 pages (Training Guide for Atari Personnel, not for release to general public).

Inside Atari Basic by Bill Carris (184 pages).

Atari Basic by Richard Haskell (180 pages).

32-page full color 1981 Atari Product catalog

36-page full color 1982 Atari Product catalog

Pile of additional sales brochures for Atari products, circa 1981/1982.

January 1, 1982 Atari Home Computer Products price list (VERY cool insider retail price sheet listing every Atari product! 6 pages).

1983 Atari Catalog (here come the XLs!)

Seven (7) documents from Atari Consumer Product Service detailing advanced programming texchniques, each document is about 32 pages, give or take. Data File Processing, Programming Examples, Atari Color Graphics, Advanced Graphics, Advanced System Features (go ahead and find this stuff elsewhere I dare ya!).

ANALOG magazine numbers 6 and 16

ANTIC magazine volume 1, numbers 4, 5, and 6

APX - Atari Program Exchange magazine Winter 1981 edition.

...and whatever else I dig up before the auction ends!

> back to where the port is opened.

The problem is a major design flaw of the serial communications
protocol of the Atari SIO interface. While the serial port of the
R: handler is in "concurrent mode" - which is required for reading
data asynchroniously, you cannot print data. While you sent data to
the printer, you cannot place the serial port in concurrent mode and
read data.

Therefore, what happens most likely is that *while* you're outputting
printer data on P:, new data arrives on R:. Since concurrent mode is
not set, the data is lost in the 850 interface box. The box has *no*
internal buffering. Data that arrives thru one of the serial ports
while concurrent mode is not active is simply lost.

Greetings,
Thomas

Ok, this is the problem I had with that.

I kept trying to send the text to a file and and my PC's printer. To send it to the printer, I got nothing, period. It woud only half-way work if i set it to append to the file each time I printed. After playing with this problem for about 9 months, I gave up. Then, about 3 months ago, I slapped together a system from spare parts and put Win ME on it, complete with APE. No problems at all.

Sometimes I get garbled characters, some times I get no characters, or sometimes it works fine.

Now, I'm no expert on hardware emulation, but... It almost behaves as if it's a problem with the printer emulator's buffer. Run a line of text to it from the Atari and you hear it beep off as it sends the data, and then it will hang for anywhere from 30 seconds to 2 minutes before it gives me the ye olde "READY".

I thought this was just a problem that I was experiencing... My original fix to it was to dig out my Atari printers and hook them up. Try as it might, APE can't emulate the good old 1020. :)

Source record: 16967

Hi David-

I'm not sure I follow what you did. But I think you were trying to print directly to a PC printer, and got no output. That would be expected if no printer driver was loaded. In my testing, older printers with built-in fonts would print with the Atari, but newer printers (even some dot matrix) need Windows or at least a Dos printer driver. The newer the printer, the less likely it is to work directly with the A8.

Then you put together a Win ME system to use with APE, and it doesn't work correctly. (?) I've not run ME with APE, but the symptoms you describe are exactly what happens with XP. Yet, APE printed perfectly on several sytems for me with W98.

Disk transfers under XP work well at 1X or 3X (2X has never worked for me, except when using SpartaDos or it's SIO driver.) I've *never* understood how the disks can transfer so well, and printing just won't work -- again with XP.

The next post has some positive news.

Larry

861. Re: APE Printing and Win XP

Source record: 16968

Ok, now for some positive news.

First, there is a really cool Win utility called "DosPrinter". It is a Win emulator of an Epson printer, using the the old Epson escape codes. It prints from a file when you activate it, or prints automatically whenever it sees a specific file name. Check it out at http://www.dsbglobal.com/dosprinter/

Caution: there are lots of old versions of this utility floating around. This is the homepage for the most recent version, complete with a full Win gui. If APE would support an (optional) EOL translation using the PC Mirror file transfer, then DosPrinter could be used very seamlessly to print Atari files. This of course presumes that file transfers work ok, which is the case for me.

Next, I've been doing some research, and I conclude that standard motherboard serial ports may not be up to the task under a Windows multi-tasking environment. Many/most motherboards now have *emulated* 16550 or "16550-compatible" serial UARTS, and this *may* be a recipe for problems with APE. I've ordered a PCI serial card with real 16550's. This is *not* the top of the line -- serial UARTS go at least up to 16950's with 128-byte buffers, but the 16550 has a 16 byte FIFO buffer, and I'm betting that will make a big difference. There's lots of info on this subject, and if you think about it, the serial UART performance would *help* explain why some people have problems with APE and others don't. I'll definitely post my results when I get my new serial card.

> so it stands to reason it would work, is there a way to put more than
> 128k in the 130xe?

I've got a 130xe with 1MB extended memory (64 banks of 16k) + standard 64k
ram installed.
I'm not sure which person made this enhancement to my machine, it was
performed in 1986
I believe. But it is possible and works great. I have ramdisk software
that set up 8 single
density disks for access and it uses standard access for the first 128k of
extended memory.
I personally wrote software to take advantage of the remainder of the memory
for general
programming and a massive ramdisk.

Your message implies that you're doing that already. You said you wait
10 seconds between lines. As long as the printer can physically print
the line in that 10 seconds, there shouldn't be a problem. If it's
still printing when the 10 seconds is up, then yes, you'll have the
problem Thomas is talking about.

I don't think you need a per character delay. The internal R: handlers
have a local buffer, usually for 256 chars. The 850 I'm not so sure
about the size, never have disassembled it's handler. Lines of less
than say, 128 chars should be able to be sent at full speed at 1200
baud. If your lines go past 256 characters because of esc sequences or
such, You might have to do something extra.

> Once loaded, the program would rotate through the pictures.

That would be an indirect test.

But my upgrade has 1MB available to both ANTIC and CPU (if the respective
PIA pin goes low). And some XL upgrades don't have separate access at all.
For those machines, your methode doesn't work.

(There are four different ways when it comes to ANTIC and CPU access to
extended memory:
a) PB4 is used to select extended RAM (ANTIC and CPU are both enabled at
the same time).
b) PB4 is used to give the CPU access to extended memory, ANTIC is always
in main memory.
c) PB4 is used to give the CPU access to extended memory, PB5 is used to
give ANTIC access to extended memory AND select memory banks (ANTIC can only
be accessed with one half of the available extended memory).
d) PB4 is used to give the CPU access to extended memory and PB5 is ONLY
used to give ANTIC access to extended memory.)

I'ld like to see a routine that can really test if the CPU and ANTIC both
have separate access.
There could be two ways:
a) ANTIC does something to memory.
b) Some address in ANTICs address rage (D4xx if I remember correctly) gets
changed.

The results of both would depend on whether ANTIC sees Main or Extended RAM.
After that we'ld have to test if ANTIC access is linked to CPU access.

Thank you for reminding me of that. Yes, I actually believe it is the Archon Ultra that I have. It came bundled in a pack of games (along with Chessmaster and some others I think). Ever since it became impossible or impractical to get some of those old DOS games to work under newer 32 bit Windows environments they just collect dust in some cranny somewhere.

You do not like Archone Ultra at all? I don't remember it real well.

There's an open source X-based clone of the original, called XArchon:

http://xarchon.seul.org

It runs on Linux, FreeBSD, and other Unix-like systems. There's also a
Windows version, but it requires an X server. The game's pretty much a
straight clone of the original with few enhancements (the graphics are
better, but that's about it).

On a 486/33 it was a dog, and it wasn't doing all that much.
I bugged the store to death before it came out, I really
wanted to like it. Original was better.

I mean Doom came out around that time, playable on a 33.

Crummy programming, I guess.

Yeah... when Doom came out everything else just kind of faded from the
mind for a while. Anyway, I wonder if ultra will work under windows
somehow. If so it certainly couldn't dog on todays hardware. Be
interesting to compare the Atari version to the Ultra version when
performance problems don't cloud the issue.

879. Tank game.

Newsgroup: comp.sys.atari.8bit
Date: 2004-02-22 00:57:48 UTC
From: russg <russg@MUNGEen.com>
Message-ID: <103fvjjcks4guf0@corp.supernews.com>
Source record: 16986

I remember a dedicated tank game machine we had during the days of VCS. It had a pair of double handle controllers, you would pull back on the left and forward on the right to turn left, with a fire button on top one of the handles.
I've looked for tank games for the 8-bit. I found a couple.
Tank vs. Tank, I can't seem to get the idea of this one, it is sort of an artillery, aim, elevation, forward-back and shoot.
Tank Commander is very much like what I'm looking for, but I don't last 30 seconds before the jet plane shoots me, and the tank is really slow to maneuvre.
Is there some way to avoid being shot by the planes?
Does anyone know of a simple tank shoot game?

Wow, my Atari 800 keyboard is working properly
again! I took it apart, discovering the 2 screws
that were under that stick foam pad that the cable
sticks to. I carefully peeled the mylar sheet off
of the circuit board, and it was clean. I think over
time, some of the mylar pads had "fused" themselves
to the circuit board, making continuous contact.

Now, another issue, the "Option" button sticks, which
seems to be caused by some plastic-to-plastic friction.
I may persue a fix for this, by cleaning, and applying
a little car wax, to the pieces where they come in
contact.

Source record: 16988

Well, I performed many experiments with the 850, and
figured I'd post the results.

Reducing the baud rate to 300 stopped the loss of characters.

I tried enabling the CTS/RTS lines at 1200 baud, no help.

On page 61 of the 850 interface manual, there is an
example of how to supply a "user buffer" for the input,
and using that example, I was able to prevent the loss of
characters at 1200 baud! I have not yet re-enabled the
code that closes the R1: port, prints the line, and reopens
the R1: port, but I intend to with the next few days. I
currently just print the line to the (Atari) screen, to
validate the characters were received OK.

I also noted that several characters such as the
"curly braces", "back tick", and "tilde" do not exist
on the Atari, thus I'm not sure I'll ever get them to
print. (on the 1025 or 1020)

In any case, I need to try to get file transfers to
work, as I had problems at 1200 baud, and I'm about
to revert to 300 baud.

> changed.
>
> The results of both would depend on whether ANTIC sees Main or Extended RAM.
> After that we'ld have to test if ANTIC access is linked to CPU access.

What about the following: Set the CPU bank to a bank containing all 0's,
the corresponding ANTIC bank to a bank containing all $FFs, then setup
Player/Missile graphics to take DMA from the ANTIC bank, then clear and
check the collision registers. In case the player do collide, then ANTIC
has really access to the ANTIC bank. In case they don't, ANTIC takes the
data (erraneously) from the CPU bank.

Happy hacking!
Thomas

883. REQ: Tower Toppler for XL/XE.

Hi,

I recently saw one go for like $9 on ebay. I think there is one
included in a big "lot" of 8bit stuff for $99 at the moment. Yes,
they are very useful! In order to test it, you will need "special"
cables, that you can make, if you are handy with a soldering iron,
and have the manuals. If not, I think I saw some info on the web, but
did not bookmark it. I currently just use port 1, that supports all
of the "modem" lines, and I'm not sure if I could test ports 2-4, or
even the parallel port however.

I could trade you something for it, but have no extra cash at the moment.

I believe MyDOS has support for the H: drive too. I believe I have used it to copy files from my hd to an image? It's been awhile, though, since I messed around with my emulator. Seems, though, there was some problems with accessing the hd with MyDOS? I think it has to be the one that was specifically written for use with emulators. I believe it was version 4.5.3 or 4.5.4?

893. Memory sizes and screwy maths

Newsgroup: comp.sys.atari.8bit

So, if you're using Atari's 8K BASIC on a 600XL, how much memory do you have to play with?

I ask because for the life of me I can't get the numbers to work out, and the last time I even touched a 600XL was in 1988. However, a clean (diskless) boot into BASIC on my 800XL leaves me with about 38kb memory free. Then we go 38 + 10 (for the OS) is 48kb; 8k for Basic gives 56kb and my Mapping the Atari (400/800 edition) talks of an unused 4k section of memory which gives 60kb. Where are those four (or possibly eight) missing kilobytes?

All I can think of is the "right cartridge" space, left over from the 800. And it gets worse because a 10kb operating system and an 8kb programming language are not going to fit into a 16kb machine.

So if I then assume that the OS counts as ROM and the rest counts as RAM, the 600XL must have had at least 26kb of memory, right? And if that was true, why was it advertised as being a 16kb machine?

Furthermore, if the 600XL was 16kb RAM and 10kb ROM and advertised as a 16kb machine, why was the 800XL touted as having 64kb? Obviously it could address that much, but so could the 400 and 800 machines, and they only went up to 48kb (+10kb OS +4kb unused = 62kb)...

Hm. What am I missing?

..PeterH

Correct.

You're mixing RAM and ROM a lot in your calcs. The machine had 64K RAM. The OS is ROM but sat on top of some of the RAM so you couldn't normally access it. Equally, the carts sit on top of RAM. Also, you haven't taken in to account memory for the screen - 38K is what's left with a Graphics 0 screen up and running. Type gr.8 then have another look at the free RAM - it wil be about 8k less.

A 16K 600 XL has 16K of RAM but with the 10K of RAM elsewhere in the memory map. To most people, a 48K RAM system looks and behaves like a 64K one because you lose the top chunk as the OS ROM and carts sit on top of it.

PeterH <peterhjr@yahoo.co.uk> wrote in message > So, if you're using Atari's 8K BASIC on a 600XL, how much memory do
> you have to play with?
>
Not much. You have about enough to load DOS 2.5, then you really don't have much. The 600XL was designed mainly to play cart or tape games, not use a disk drive.
Your Mapping the Atari has a memory map in the appendices, I believe.
With an 800XL, you can use page 6, but up to about $2000 is used by the OS and DOS. There's a MEMLO or some address that tells you where you have user RAM. From 0 to the 'top' of DOS isn't available. From about $2000 to $BFFF is where you can use.
That's about $9000 bytes, 36000 decimal. With BASIC enabled you have 8K less, about 28000, BASIC is in left cart $A000-$BFFF.
SpartaDOS uses some RAM under $C000 to... $C200? Also Turbo BASIC, standard addition, uses some RAM under the OS.
Some carts can be up to 128K, something I never understood, you can bank switch part of the cart area, I think from B000 to BFFF.
From $C000 to $FFFF, 16k is the OS, hmm.. it is a 10k OS.
You're doing a ? FRE(0) to get your free memory, it is from MEMLO (or LOMEM?) to $AFFF, minus the display list and screen memory that loads just under $AFFF. Location 106 decimal has the number of pages available from the top of DOS to the top of the display list and screen memory.

Shoot I said from top of DOS to $AFFF. That should be
$9FFF with BASIC, $BFFF without BASIC, the display list and screen memory go
just under the top of user area, just under $9FFF or $BFFF, and depends on
the graphics mode how much the DL and screen take.

The guy who runs the CAS archive sent me a few images that seem to use a sort
of 'fast loader'.

It seems there is software that will take a standard cassette title and repack
it with a turbo load
program at the beginning of the tape.

The first few blocks of the casette load at regular speed, then it kicks up to
about 2-3x normal
speed for the rest of the tape, which is the original data just repacked.

They seem to work pretty well. Load times are still staggering for big games
but a still a relief from
600 baud xfers :)

I soldered in jumper wires from port one to port four, that way I have two RS232's and don't have to plug and unplug between my voice synth and my modem. The last port (I think 4) is by default one of those 20ma loop connections, I just cut the traces and jumpered it.
Rambling,

Hi,

> Did the Atari ever use fastloaders for its tape games only games seem to
> take forever to load.

The main problem with that is that the "encoding" logic of the tape
(i.e. create the modulation for the binary) is in the Atari, but the
decoding (identify the bits from the frequencies) is in the tape. The
Atari tape recorder wasn't an ordinary tape deck, but contained the
necessary parts to restore the binary data back from the frequency
modulation. Thus, you couldn't really change that by software.

So long,
Thomas

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

I had a utility (name forgotten now) that could read a casette image to
memory, and then write it back at any baud rate from 600 to 1200 (I
think). 850 was the maximum I could go without getting errors. Quite nice!

>
Your 600XL must have been modified if it has more than 16KB free. The 600XL
used two 16kx4 ram chips, but with a slight modification to the board the
ram chips could be replaced with 64kx4.

> Furthermore, if the 600XL was 16kb RAM and 10kb ROM and advertised as

> could address that much, but so could the 400 and 800 machines, and
> they only went up to 48kb (+10kb OS +4kb unused = 62kb)...
>
The 800XL had 14K of ROM which could be bank-switched, allowing access
to 62K of RAM (2K was used for I/O devices). Some programs that used the
RAM "under the OS" were Spartados, TurboBasic, Atari DOS XE, and the Atari
Translator disk (the Translator was a copy of the old 800 ROM).

915. FS:Large qts. of boxed+new XEGS carts

Newsgroup: comp.sys.atari.8bit
Date: 2004-02-25 08:39:34 UTC
From: bobbygehtheim@yahoo.de
Message-ID: <831dc9f8.0402250039.5a486cfb@posting.google.com>
Source record: 16872

Hi,

I can offer large qts. of several ATARI XEGS/XL cartridge games, all
boxed and new.

Good for resellers or for homebrew-authors.

I sell each game for 3 Euro.1 Euro is ca. $1.27 now, but buyers from
outside the European Union neednï¿½t to pay the 16$ sales taxes.

Shipping : up to 40 games 29 Euro
up to 150 games 59 Euro

Shipping Europe : up to 40 games 16.50 Euro
up to 150 games 31.50 Euro

I can accept money orders/checks.

Please note : The XL games in silver boxes - Millipede/Robotron etc.
work on all ATARI computers - ATARI 400,800,XL machines,XE machines.

The XEGS carts - such as Archon etc. require at
least 48K of memory , some - like Thunderfox- only work with 64K , so
these games may not be compatible with the ATARI 400/800 , but will
work on ATARI 800 XL/800 XE , 65 XE/130 XE , 1200 XL and XE Gamesystem
and 600XL with 64K memory.

Thimo Graef

bobbygehtheim@yahoo.de or lord-chaos@t-online.de

XEGS carts are the cartridge games in the blue XEGS boxes.They work on
ATARI 800 XL , 800 XE , 65 XE , 130 XE and 1200 XL and the XE
Gamesystem.

Some require 64K, so they wonï¿½t run on the ATARI 800.

If you want to see pictures of the gamesï¿½ boxes,instructions and
carts,
please use the links.

920. Re: Is it possible to detect if ANTIC has separate access to extended memory

Newsgroup: comp.sys.atari.8bit
Date: 2004-02-25 19:56:07 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <403CFDD7.587F8EB1@students.uni-mainz.de>
Source record: 16877

Well,
afaik most (if not all) XL upgrades do not have the so-called "separate Antic access" - so why bother ?!? Do you want to have software that merely works on a few XE computers (and not at all on 400/800 and XL computers) ?!? At the moment I am quite happy that there are only 2 programs that make use of the separate Antic access (Video Blitz and The [Sparta DOS] Wedge)...

Correct me if I am wrong, but someone told me, that the separate access depends on 1) the ramdisk and the ramdisk size (if a certain bit is used for the ramdisk / the rambanks, then separate Antic access is not possible) and 2) some chips inside your XL/XE computer (the Gate Array Chip and the Freddie Chip - only the 130XE has the Gate Array chip, only a few XL`s do have the Freddie chip)... Thus it will not be possible to upgrade all (already RAM upgraded) XL computers for separate Antic access and so this special mode looks a little useless to me - if we want XL/XE compatibility... -Andreas.

If Atariland's email is down, that may explain part of the reason why
we can't get a hold of Ron Hamilton ? Do you think ?

922. Old Atari 130XEs for sale (and a question regarding one of them...)

Newsgroup: comp.sys.atari.8bit
Date: 2004-02-25 20:02:08 UTC
From: Mark Steele <msteele@aspenres.com>
Message-ID: <103pvq1q7ka2ob5@corp.supernews.com>
Source record: 16879

I got into Atari in '82 with an Atari 400 and later got an 800 with an 810 disk drive.
I used it for years before moving to the 16/32 bit world with the ST and later Macintosh.
Years ago I tried to resurect my interest in the old Atari world and found a used 130XE
and the BlackBox (for hooking up a SCSI HD and floppy pulled from a PC). I was
concerned that the used XE wouldn't work so I found a few others for spare parts.
Turns out that all three powered up and the one I connected to the blackbox worked
just fine so I never tried to check out the two (other than the power up).
I've decided to part with the remaining two 130XEs and while I was checking that they
still powerup I noticed that one of them has something called OmniView that appears
to give 80 col. on a suitable display. The papers inside the box along with the OmniView
reference something called RamRod.

So, I never had a chance to see what OmniView is or RamRod, so does anybody know
what these things are?

I've been doing much of my 8-bit Atari computing with emulators on Mac OS X.
I think it would be great if this emulator was put on a Palm OS, but the resolution
proboably isn't there, but it would be fun anyway.

-Mark

BTW the two machines are on eBay if anybody is interested

Stock Atari 130XE:
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3079991452&category=62054

Atari 130XE w/ Omniview (I can't confirm RamRod so I didn't list it):
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3079990816&category=62054

Omniview is a replacement OS ROM that includes a 80 column text display
handler.

The Ramrod board is a 3-in-1 OS board that was sold by Newell. You remove
the OS rom and replace it with a large PCB. That PCB has 3 sockets for OS ROMS.

I had a few of these boards way back when, it was a quality product. Mine
had Omnimon, Omniview and the regular XL OS chip.

It could be!

I'm not entierly convinced by the Arguments though as this versitility
came at the prohibitive cost of expensive hardware ad-ons.

Certainly the beeb was capable having some nifty funcionality. And it
was the birth place of Elite.

Lets face it, at the end of the day comparing Beebs with Atari
800/XL/XE with C=64 with Amstrad CPC with Spectrums is a bit like
arguing over which is the better sports car out of the the MGB,
Triumph Spitfire, Sunbeam Alpine or any other British 'classic' 60's
sport car! Rather a matter of personal choice. That said The Atari
8-bits remained viable contenders in the UK market throughout the 80's
and not many other machines can claim that!

I don't think it's too much money, a nice 800xl and disk drive with games and carts can run anywhere from $50-100. This set has boxes for its units and a lot of extras, I probably wouldn't pay too much more than $100 but for someone getting back into the 8bits the price isn't outlandish.

The addition of a PCI serial card with real 16C550 UARTs made only a small amount of difference. Given the line to print:
10 LPRINT "PRINT THIS LINE MANY TIMES":GOTO 10
My system will now print this line many times before printing finally hangs.

If I insert a very small delay
FOR W=1 TO 20:NEXT W:
then it will print endlessly.

If I try to COPY a file (DOS) or LIST "P:", then printing hangs pretty much the same as always. (Rats!)

The search goes on...

>that, how can the Atari...

Did I say better? I said more versatile. You can do a hell of a lot more with an Apple][than an Atari 8-bit, just in terms of sheer tasks you can set it to with off-the-shelf software and hardware - and making your own is very easy.

The BBC B is half-way between Apple][and Atari - you get more colours, slightly higher res, good 80 column mode and 3 channel sound plus speech and noise generator, but you lose expansion slots in favour of bus-based expansion and onboard (soldered) upgrades for network and disc interfaces - though most have the latter anyway.

Besides, show me an Atari 400-family computer that can beat an Apple IIgs in any way ;)

The Apple IIGS came out almost 10 years after the Atari 400. The
Atari 520ST/Amiga were more it's contemporaries (and much better).

Bzzt. The Atari 400 came out in 1979. The Apple IIgs was launched in
1986, and whilst it is a 16-bit model, it is almost 100% compatible
without emulation with the 8-bit line. It is to the 400 what the 130XE
should have been.

In what way is an ST better than a IIgs, beyond clock speed. Answer
carefully here.

That's what I said almost 10 years. There is no comparison between
the atari 400 and IIGS. The Atari ST was compatible with 8bit
software too (through emulation) and it was around the same price.

>In what way is an ST better than a IIgs, beyond clock speed. Answer
>carefully here.

The Atari ST and Amiga were far better than the IIGS. More software
better graphics what do you want to hear? The Amiga was years ahead
of its time (in multimedia etc..) the ST was faster then a Macintosh
and that's running Mac software.

The 130xe was just Atari's way of getting rid of their storehouse of
8bit parts. It would have been nice if Atari made a super-8bit like
the IIGS but the ST was so inexpensive it would have competed directly
with that product.

As a follow up to this thread I just found out that my email to the
Retro gamer magazine editor got printed in the new issue with a reply
that there's a special article being drafted covering the 8 bit..

Sadly that almost certainly means that it will be a one off article
and the rest of the mags will cover the same old two some..

:-(

Anyone?

I've only rarely dabbled in IRC myself, maybe tried #atari8 once or twice years ago.

If someone can confirm that #atari8 does or doesn't exist now, please post or let me know!

Thanks,

-Michael

I haven't liked any of the web based BBS systems I've seen. I called BBSs from
'84 to 2K and have had Inet access since '96. I ran a WWIV BBS from '95 'til
2K.

I liked the game as well. I liked the duels you could have with the mountain top fortresses. I remember when I had the first alien jumped on my ship. I sat there stunned a minute trying to figure out what to do. If you left the door open too long, an alien could get inside the ship.

Sorry- I mean to say HERO (Activision), the coal-miner level-based game - not Universal HERO, thats something else from UK (?).

Montezuma Revenge is also a good underground level game. So as Spellunker - great.

It's 7 years. When you're asking 10,000 for your car, I'll offer 7 ;)

The ST was not compatible with 8-bit software to any degree without
emulation. The IIgs is to all intents and purposes an Apple][, with a
16-bit CPU and enhanced graphics and sound.

>The Atari ST and Amiga were far better than the IIGS. More software
>better graphics

The ST had better graphics than a IIgs?! Have you ever seen a IIgs? And
as far as sound goes, neither the AY or Paula can compete with a
15-channel stereo sound chip designed by a synthesizer manufacturer
(Ensoniq).

>what do you want to hear? The Amiga was years ahead
>of its time (in multimedia etc..) the ST was faster then a Macintosh
>and that's running Mac software.

The IIgs was faster than a Mac, in colour, when clocked to 8Mhz and
compared to the more expensive Mac SE. Most accelerators go to 14 or
20Mhz.

>The 130xe was just Atari's way of getting rid of their storehouse of
>8bit parts. It would have been nice if Atari made a super-8bit like
>the IIGS but the ST was so inexpensive it would have competed directly
>with that product.

Nah, there's no competition. The 520ST is far, far worse than a IIgs. A
IIgs can even handle more than 4Mb RAM ;)

The IIGS was a powerful computer, but it had a lot of drawbacks.
There was not as much software for that machine because of it's
backward compatibility compared to the Amiga and ST. Both the Amiga
and ST were faster machines. True you could accelerate a IIGS, this
was also possible on the ST/AMIGA. There is no way a IIGS could run
MAC software. The ST/AMIGA both had 68000 - 68030 cpu's so they could
emulate a MAC faster then an actual macintosh (sounds unbelievable but
true). The IIGS was the "ultimate" 8-bit computer and I would have
loved for Atari to continue the 800 in that same way. I owned an ST
at one time, but I was really more an AMiga freak back in the day, so
I can speak mainly for that platform. The IIGS had some nice
graphical features, but it could not touch the AMIGA. Apparently it
did have quite an advanced sound chip as you say. One thing I
remember is the Amiga could easily emulate an Apple II, so that pretty
much puts the two machines on a level platform (no pun) also the ST
was emulating a MAC before any other computer.

Still the IIgs was unique and had some advanced features, but there
was much less software to take advantage of them when compared to the
competition.

949. More about Rescue on Fractalus

Newsgroup: comp.sys.atari.8bit
Date: 2004-02-28 17:33:37 UTC
From: Anders Skelander <ansk@hotmail.com>
Message-ID: <Hh40c.27488$zm5.8888@nntpserver.swip.net>
Source record: 16906

I read a thread about how Lucasfilm's "Rescue on Fractalus" works in this forum recently.

I want to add these comments.

About fractals. I have not checked any facts, only seen computer images that represent what is supposed to be fractals. But isn't the definition of a fractal, a pattern that has idefinite depth? If one (in a visual representation) zooms in what seems to be a small detail, more details can be found, and when going deeper in them, more details are found et cetera. If that is the definition, or regardless: Maybe it is possible to define a specific formula that can be used to generate a virtual landscape, computed in real-time on the Atari. I have returned to this idea occasionally during the years, but I have never had time, and probably not the mathematical/logical skills, to figure out a solution.

I am referring to a three dimensional landscape here, shown on the two dimensional Atari screen.

An alternative idea that possibly is less hard to figure out and to implement, is a two dimensional landscape that has an indefinite size, and of course a non-repetitive pattern.

The other issue I wanted to comment is more hands on. Nearl J Icarus refers to mountain top fortresses in his description of what is exciting about "Rescue on Fractalus". Are there really fortresses in this game? I only remember the flying saucers.

Not quite in the same way, or quite as quickly - the IIgs was throttled back to avoid competition with the SE...

>There is no way a IIGS could run
>MAC software.

...since it offered colour and higher resolution than the Mac's 512 x 384, and with GS/OS an equally competent OS. AppleWorks GS could blend Vector and bitmap objects, for example.

>The ST/AMIGA both had 68000 - 68030 cpu's so they could
>emulate a MAC faster then an actual macintosh (sounds unbelievable but
>true).

Damnit, Mac is an abbreviation, not acronym. Why the caps? Anyway, since I have a Spectre GCR for my STE, I know that it is a - almost believable, and b - not actually all that possible on the Amiga. Compatibility isn't great, either. The Mac range had the '030 before Atari or Commodore bothered.

>The IIGS was the "ultimate" 8-bit computer and I would have
>loved for Atari to continue the 800 in that same way.

The IIgs is a 16-bit. It has more addressing capability that the ST and Amiga - it can handle 14Mb RAM, as much as a Falcon.

>I owned an ST
>at one time, but I was really more an AMiga freak back in the day, so
>I can speak mainly for that platform. The IIGS had some nice

That depends on what you value. Workbench looks like crap compared to GS/OS.

>Apparently it
>did have quite an advanced sound chip as you say. One thing I
>remember is the Amiga could easily emulate an Apple II, so that pretty
>much puts the two machines on a level platform

So where'dya plug your Z80 card, or Mockinboard, or additional 5.25"
drive controller, or internal SCSI card with SCSI HD. Did I mention that
the IIgs had 1.44 floppies before the ST and Amiga too? And again, the
IIgs wasn't 'emulating' an Apple][. Plug a IIgs into a mono monitor and
don't let it bootstrap GS/OS. You have an Apple][, right there.

>(no pun) also the ST
>was emulating a MAC before any other computer.

The 'Jackintosh' (ST) is very similar to a Mac. That much is obvious by
being able to plug in the ROMs and GCR circuitry in a cartridge, and
have it run Mac software at a similar speed with a higher resolution
than a Plus. It even emulates sound. It's still not 100% compatible, and
have you forgotten why there aren't loads of Spectres around, or
MagicSac? Because you needed the ROMs from a Mac Plus.

> Still the IIgs was unique and had some advanced features, but there
>was much less software to take advantage of them when compared to the
>competition.

There was adequate software. There was less, and I agree, but it lacked
games more than anything else - the games that were developed were very
impressive, and the IIgs was often used for developing SNES games.

Hey everyone. I'm hoping someone can help me out. I would like to use OSS (others too perhaps) supercarts in an Atari8 emulator. Come to think of it I would like to use SDX also. Now, I see that Atariwin+ and the Atari++ emulators seem to have support for this but... no matter what I try I can't get any of the supercart ROM image files to work in emulation correctly. I think I had BASIC XE or XL come up on screen once but it was unstable as all heck. I personally own Mac/65, BASIC XL, Action! and a SpartaDOS X cart. Can I use these in emulation yet or not? Do I have bad ROM dumps in the files I tried? If so can I make good ROM dumps of the super carts I own? I would rather not reinvent the wheel trying to dump my carts, especially since they are not all the latest revisions, but I will if I have to.

Being able to use the SDX and my Action! cart are the most important. Actually the Action cart because I have old source code of personal programs that I wrote to compile.

I have felt kind of dumb like I'm just not with the program when I couldn't get the things to work under emulation. You guys can almost always be counted on to know the solution, so I'm asking for your help. Help! :-)

>Atari or Commodore bothered.

What? The Amiga had full macintosh emulation check out "the emplant"
and several earlier macintosh emulators, the Amiga was a better mac
then the mac (for awhile at least).

>The IIgs is a 16-bit. It has more addressing capability that the ST and
>Amiga - it can handle 14Mb RAM, as much as a Falcon.

yes, I realise it was 16-vbit, but it was really the ultimate Apple II
computer anotherwords I was trying to say that a similar Atari
computer (with that 6502 compat processor) would have been nice.

>That depends on what you value. Workbench looks like crap compared to
>GS/OS.

You know thisis getting down to a matter of opinion, the Amiga had
some very advanced graphics for it's time and while workbench may not
have been as pretty your OS (they both look pretty awful nowadays) it
was well ahead of it's time in other departments (pre-emptive
multitasking for example)

>So where'dya plug your Z80 card, or Mockinboard, or additional 5.25"
>drive controller, or internal SCSI card with SCSI HD.

Both the amiga and St had tons of third party addons. Where did you
plug your 486 in the IIGS? The Amiga could emulate a 486 at full
speed with the bridgeboard and as well as a macintosh. Two feats near
impossible on the IIGS. Im not sure about the ST, but the Amiga
originally had a 5.25 floppy drive available as well. SCSI was the
standard for the amiga, my Amiga 500 had a dataflyer scsi card and a
quantum hard drive, other amigas like 2000 and 3000 came with built in
scsi support.

>There was adequate software. There was less, and I agree, but it lacked
>games more than anything else - the games that were developed were very
>impressive, and the IIgs was often used for developing SNES games.

Im not surprised the IIGS was used to develope SNES games since the
SNES had the same CPU. I guess you are a big fan of IIGS, I had a

friend who had one and it was a dissapointment, but of course any computer when used to its fullest can do some impressive things. I donot regret picking an Amiga instead. By the time the IIGS came out, Apple II software was old hat to me, so that was not a selling point.

Getting back on topic, their were several movements to make a next generation 16 bit atari 800 like the IIGS, one was even released and there was a couple software programs for it. I think the 680x0 was a more versatile chip that simply had more horsepower. There couldnt have been an accellerator for the IIGS that could reach the speeds of a 68060 or 68040 w/MMU so there was no real future for that platform (not that their was a long one for the 680x0 either)

Yup, that was the name. ISTR their comment that the Amiga was not quite
powerful enough to pull it off, or something to that effect... I'm
guessing they were referring to the lack of lower resolution, and/or the
char-mapped mode.

Hi,
With either Atari800Win 3.1 or 4.0 Beta:

ALT+F ALT+C will open a dialogue fileselector >>> Pick your choice of ROM
(Cartridge Image). Next dialogue box will ask which type of Image is being
loaded (select proper Image type) (i.e..) SDX will be the forth choice on
the list. Some CAR files are self selecting with proper file header..

I hope this isn't a confusing answer. For other ROM types Trial and error
works also or search the web for cartridge types to select.

Good Luck!

>I missing something? It's driving me crazy!

I once tried to get an old 2600 in a case and I lost it. It went
for over $300. Some people do not realize you can get an XL from
places like Best Electronics a little cheaper than $200. Still, I
paid around $300 for my old Atari 400. To me, it was and still is
worth it.

959. Ram Operating System Utility (?)

Newsgroup: comp.sys.atari.8bit
Date: 2004-02-29 16:27:17 UTC
From: llppwhite@aol.comnsp
Message-ID: <20040229112717.03173.00000616@mb-m23.aol.com>
Source record: 16916

I'm testing some different operating systems, and I've just been burning a new eprom each time I try another one. Certainly doable, but a little time-consuming.

So I'm looking for a utility that could copy an OS image into memory underneath the ROM OS and then "switch". Essentially that's what the Atari Translator disks do. I've got a couple of programs that will copy the ROM to RAM, but can't find anything that does quite what I'm looking for.

Does anyone recall a utility that does this?
Hmm, I just remembered the "Homemade Translator" from Analog -- Perhaps that might do it. But I'd still like to hear of any others that anyone may remember.

Thanks,
Larry

Thanks for the info. What file header? Can anyone help me with
getting good working ROM image files? If not, can you tell me how to
make my own from my own carts?

Straight from the Help file of Atari800Win Atari800Win.hlp
Most OSS carts are type 15 on this list..
----------start help
The following table lists currently supported cartridge types:

Id Machine Size Name
1 800/XL/XE 8 Standard 8 KB cartridge
2 800/XL/XE 16 Standard 16 KB cartridge
3 800/XL/XE 16 OSS '034M' 16 KB cartridge
4 5200 32 Standard 32 KB 5200 cartridge
5 800/XL/XE 32 DB 32 KB cartridge
6 5200 16 Two chip 16 KB 5200 cartridge
7 5200 40 Bounty Bob Strikes Back 40 KB 5200 cartridge
8 800/XL/XE 64 64 KB Williams cartridge
9 800/XL/XE 64 Express 64 KB cartridge
10 800/XL/XE 64 Diamond 64 KB cartridge
11 800/XL/XE 64 SpartaDos X 64 KB cartridge
12 800/XL/XE 32 XEGS 32 KB cartridge
13 800/XL/XE 64 XEGS 64 KB cartridge
14 800/XL/XE 128 XEGS 128 KB cartridge
15 800/XL/XE 16 OSS 'M091' 16 KB cartridge
16 5200 16 One chip 16 KB 5200 cartridge
17 800/XL/XE 128 Atrax 128 KB cartridge
18 800/XL/XE 40 Bounty Bob Strikes Back 40 KB cartridge
19 5200 8 Standard 8 KB 5200 cartridge
20 5200 4 Standard 4 KB 5200 cartridge
21 800 8 Right slot 8 KB cartridge
22 800/XL/XE 32 32 KB Williams cartridge
23 800/XL/XE 256 XEGS 256 KB cartridge
24 800/XL/XE 512 XEGS 512 KB cartridge
25 800/XL/XE 1024 XEGS 1 MB cartridge
26 800/XL/XE 16 MegaCart 16 KB cartridge
27 800/XL/XE 32 MegaCart 32 KB cartridge
28 800/XL/XE 64 MegaCart 64 KB cartridge
29 800/XL/XE 128 MegaCart 128 KB cartridge
30 800/XL/XE 256 MegaCart 256 KB cartridge
31 800/XL/XE 512 MegaCart 512 KB cartridge
32 800/XL/XE 1024 MegaCart 1 MB cartridge

33 800/XL/XE 32 Switchable XEGS 32 KB cartridge
34 800/XL/XE 64 Switchable XEGS 64 KB cartridge
35 800/XL/XE 128 Switchable XEGS 128 KB cartridge
36 800/XL/XE 256 Switchable XEGS 256 KB cartridge
37 800/XL/XE 512 Switchable XEGS 512 KB cartridge
38 800/XL/XE 1024 Switchable XEGS 1 MB cartridge
39 800/XL/XE 8 Phoenix 8 KB cartridge
40 800/XL/XE 16 Blizzard 16 KB cartridge

There are two formats of cartridge images: raw and CART.

The raw dump contains no information of how to handle the cartridge, thus you are prompted to choose its type each time you attach a raw cartridge. There is no special extension for raw cartridges, but most common are ROM and BIN (recommended is ROM).

The CART file (with CAR extension) contains information about cartridge type, so it can be attached without prompting you for the type. Additionally the CART format can be identified, because it contains the 'CART' signature at the beginning of the file.

Details of cartridge types

Type 1: Standard 8 KB cartridge
Standard 8 KB cartridge, that occupies 8 KB of address space between $A000 and $BFFF.

Type 2: Standard 16 KB cartridge
Standard 16 KB cartridge, that occupies 16 KB of address space between $8000 and $BFFF.

Type 3: OSS '034M' 16 KB cartridge
There are two types of OSS cartridges. Both are 16 KB and occupy 8 KB of address space between $A000 and $BFFF. The cartridge memory is divided into 4 banks, 4 KB each. One bank ('main') is always mapped to $B000-$BFFF. The other 3 banks are mapped to $A000-$AFFF. The current bank is selected by accessing a byte in $D500-$D5FF. Only 4 lowest bits of address are significant.

The '034M' scheme is the more complicated one. The main bank is D. An access to:
- $D5x0 or $D5x1 selects bank A.
- $D5x3 or $D5x7 selects bank B.
- $D5x4 or $D5x5 selects bank C.
- $D5x2 or $D5x6 is not useful. It disables ROM (there're $FF bytes in $A000-$AFFF).
- $D5x8-$D5xF disables whole cartridge (enables computer's memory in address space between $A000 and $BFFF).

Type 4: Standard 32 KB 5200 cartridge

Standard 32 KB cartridge for Atari 5200, that occupies 32 KB of address space between $4000 and $BFFF.

Type 5: DB 32 KB cartridge

A 32 KB bank-switched cartridge. There are 4 banks. Bank D is mapped to $A000-$BFFF. Bank in $8000-$9FFF is selected by an access to $D500-$D5FF. Two lowest bits of address select bank A, B, C or D.

Type 6: Two chip 16 KB 5200 cartridge

In Atari 5200 there's 32 KB of address space reserved for the cartridge ($4000-$BFFF). A two chip 16 KB cartridge is mapped that way:

- First 8 KB are mapped into lower 16 KB. Since an address line is not connected, $4000-$5FFF and $6000-$7FFF contain same data, which is first half of the cartridge image.

- Similarly, second 8 KB are mapped into upper 16 KB.

Type 7: Bounty Bob Strikes Back 40 KB 5200 cartridge

The cartridge with "Bounty Bob Strikes Back" game uses very strange bank switching method:

- Four 4 KB banks (A,B,C,D) are mapped into $4000-$4FFF. An access to $4FF6 selects bank A, $4FF7 - bank B, $4FF8 - bank C, $4FF9 - bank D.

- Four 4 KB banks (E,F,G,H) are mapped into $5000-$5FFF. An access to $5FF6 selects bank E, $5FF7 - bank F, $5FF8 - bank G, $5FF9 - bank H.

- The remaining 8 KB is mapped to upper 16 KB of cartridge address space in Atari 5200. That is, $8000-$9FFF and $A000-$BFFF contain same data.

Type 8: 64 KB Williams cartridge

The cartridge has 8 banks mapped to $A000-$BFFF. An access to $D500 selects bank A, $D501 - bank B, etc. An access to $D508-$D50F disables the cartridge.

Type 9: Express 64 KB cartridge

The cartridge has 8 banks mapped to $A000-$BFFF. An access to $D577 selects bank A, $D576 - bank B, etc. An access to $D578-$D57F disables the cartridge.

Type 10: Diamond 64 KB cartridge

The cartridge has 8 banks mapped to $A000-$BFFF. An access to $D5D7 selects bank A, $D5D6 - bank B, etc. An access to $D5D8-$D5DF disables the cartridge.

Type 11: SpartaDOS X 64 KB cartridge

The cartridge has 8 banks mapped to $A000-$BFFF. An access to $D5E7 selects bank A, $D5E6 - bank B, etc. An access to $D5E8-$D5EF disables the cartridge.

Type 12: XEGS 32 KB cartridge

This bank-switched cartridge occupies 16 KB of address space between $8000
and $BFFF. The cartridge memory is divided into 4 banks, 8 KB each. Bank D
(the last one) is always mapped to $A000-$BFFF. Two lowest bits of a byte
written to $D500-$D5FF select the bank mapped to $8000-$BFFF.

Type 13: XEGS 64 KB cartridge

This bank-switched cartridge occupies 16 KB of address space between $8000
and $BFFF. The cartridge memory is divided into 8 banks, 8 KB each. Bank H
(the last one) is always mapped to $A000-$BFFF. Three lowest bits of a byte
written to $D500-$D5FF select the bank mapped to $8000-$BFFF.

Type 14: XEGS 128 KB cartridge

This bank-switched cartridge occupies 16 KB of address space between $8000
and $BFFF. The cartridge memory is divided into 16 banks, 8 KB each. Bank P
(the last one) is always mapped to $A000-$BFFF. Four lowest bits of a byte
written to $D500-$D5FF select the bank mapped to $8000-$BFFF.

Type 15: OSS 'M091' 16 KB cartridge

This is the simpler one of OSS schemes. It uses only A0 and A3 address
lines:
- A3=0, A0=0 - $A000-$AFFF: bank B, $B000-$BFFF: bank A
- A3=0, A0=1 - $A000-$AFFF: bank D, $B000-$BFFF: bank A
- A3=1, A0=0 - disable cartridge
- A3=1, A0=1 - $A000-$AFFF: bank C, $B000-$BFFF: bank A

Type 16: One chip 16 KB 5200 cartridge

16 KB cartridge for Atari 5200, that occupies 16 KB of address space between
$8000 and $BFFF.

Type 17: Atrax 128 KB cartridge

This bank-switched cartridge occupies 8 KB of address space between $A000
and $BFFF. The cartridge memory is divided into 16 banks, 8 KB each. If a
byte written to $D500-$D5FF has highest bit set, the cartridge is disabled.
Otherwise four lowest bits select the bank mapped to $A000-$BFFF.

Type 18: Bounty Bob Strikes Back 40 KB cartridge

The cartridge with "Bounty Bob Strikes Back" game uses very strange bank
switching method:

- Four 4 KB banks (A,B,C,D) are mapped into $8000-$8FFF. An access to $8FF6
selects bank A, $8FF7 - bank B, $8FF8 - bank C, $8FF9 - bank D.

- Four 4 KB banks (E,F,G,H) are mapped into $9000-$9FFF. An access to $9FF6
selects bank E, $9FF7 - bank F, $9FF8 - bank G, $9FF9 - bank H.

- The remaining 8 KB is mapped to $A000-$BFFF.

Type 19: Standard 8 KB 5200 cartridge

Standard 8 KB cartridge for Atari 5200, mapped into $8000-$9FFF and $A000-$BFFF.

Type 20: Standard 4 KB 5200 cartridge

Standard 4 KB cartridge for Atari 5200, mapped into $8000-$8FFF, $9000-$9FFF, $A000-$AFFF and $B000-$BFFF.

Type 21: Right slot 8 KB cartridge

8 KB cartridge for Atari 800, mapped into $8000-$9FFF. Atari 800 was the only 8-bit Atari with a Right Cartridge slot, in addition to the Left Cartridge slot as present on all 8-bit Ataris.

Type 22: 32 KB Williams cartridge

The cartridge has 4 banks mapped to $A000-$BFFF. An access to $D500 selects bank A, $D501 - bank B, etc. An access to $D508-$D50F disables the cartridge.

Type 23: XEGS 256 KB cartridge

This bank-switched cartridge occupies 16 KB of address space between $8000 and $BFFF. The cartridge memory is divided into 32 banks, 8 KB each. The last bank is always mapped to $A000-$BFFF. Five lowest bits of a byte written to $D500-$D5FF select the bank mapped to $8000-$BFFF.

Type 24: XEGS 512 KB cartridge

This bank-switched cartridge occupies 16 KB of address space between $8000 and $BFFF. The cartridge memory is divided into 64 banks, 8 KB each. The last bank is always mapped to $A000-$BFFF. Six lowest bits of a byte written to $D500-$D5FF select the bank mapped to $8000-$BFFF.

Type 25: XEGS 1 MB cartridge

This bank-switched cartridge occupies 16 KB of address space between $8000 and $BFFF. The cartridge memory is divided into 128 banks, 8 KB each. The last bank is always mapped to $A000-$BFFF. Seven lowest bits of a byte written to $D500-$D5FF select the bank mapped to $8000-$BFFF.

Type 26: MegaCart 16 KB cartridge

A 16 KB cartridge, that occupies 16 KB of address space between $8000 and $BFFF, and can be disabled by writing a byte with bit 7 set to $D500-$D5FF.

Type 27: MegaCart 32 KB cartridge

A bank-switched cartridge that occupies 16 KB of address space between $8000 and $BFFF. It is controlled by a byte written to $D500-$D5FF. Bit 0 selects one of two available banks, bit 7 disables the cartridge.

Type 28: MegaCart 64 KB cartridge

A bank-switched cartridge that occupies 16 KB of address space between $8000 and $BFFF. It is controlled by a byte written to $D500-$D5FF. Bits 0 and 1 select one of four available banks, bit 7 disables the cartridge.

Type 29: MegaCart 128 KB cartridge

A bank-switched cartridge that occupies 16 KB of address space between $8000 and $BFFF. It is controlled by a byte written to $D500-$D5FF. Bits 0,1,2 select one of 8 available banks, bit 7 disables the cartridge.

Type 30: MegaCart 256 KB cartridge

A bank-switched cartridge that occupies 16 KB of address space between $8000 and $BFFF. It is controlled by a byte written to $D500-$D5FF. Four lowest bits select one of 16 available banks, bit 7 disables the cartridge.

Type 31: MegaCart 512 KB cartridge

A bank-switched cartridge that occupies 16 KB of address space between $8000 and $BFFF. It is controlled by a byte written to $D500-$D5FF. Five lowest bits select one of 32 available banks, bit 7 disables the cartridge.

Type 32: MegaCart 1 MB cartridge

A bank-switched cartridge that occupies 16 KB of address space between $8000 and $BFFF. It is controlled by a byte written to $D500-$D5FF. Six lowest bits select one of 64 available banks, bit 7 disables the cartridge.

Type 33: Switchable XEGS 32 KB cartridge

This bank-switched cartridge occupies 16 KB of address space between $8000 and $BFFF. The cartridge memory is divided into 4 banks, 8 KB each. Bank D (the last one) is always mapped to $A000-$BFFF. Two lowest bits of a byte written to $D500-$D5FF select the bank mapped to $8000-$BFFF, bit 7 disables the cartridge.

Type 34: Switchable XEGS 64 KB cartridge

This bank-switched cartridge occupies 16 KB of address space between $8000 and $BFFF. The cartridge memory is divided into 8 banks, 8 KB each. Bank H (the last one) is always mapped to $A000-$BFFF. Three lowest bits of a byte written to $D500-$D5FF select the bank mapped to $8000-$BFFF, bit 7 disables the cartridge.

Type 35: Switchable XEGS 128 KB cartridge

This bank-switched cartridge occupies 16 KB of address space between $8000 and $BFFF. The cartridge memory is divided into 16 banks, 8 KB each. Bank P (the last one) is always mapped to $A000-$BFFF. Four lowest bits of a byte written to $D500-$D5FF select the bank mapped to $8000-$BFFF, bit 7 disables the cartridge.

Type 36: Switchable XEGS 256 KB cartridge

This bank-switched cartridge occupies 16 KB of address space between $8000 and $BFFF. The cartridge memory is divided into 32 banks, 8 KB each. The last bank is always mapped to $A000-$BFFF. Five lowest bits of a byte written to $D500-$D5FF select the bank mapped to $8000-$BFFF, bit 7 disables the cartridge.

Type 37: Switchable XEGS 512 KB cartridge

This bank-switched cartridge occupies 16 KB of address space between $8000 and $BFFF. The cartridge memory is divided into 64 banks, 8 KB each. The last bank is always mapped to $A000-$BFFF. Six lowest bits of a byte written to $D500-$D5FF select the bank mapped to $8000-$BFFF, bit 7 disables the cartridge.

Type 38: Switchable XEGS 1 MB cartridge

This bank-switched cartridge occupies 16 KB of address space between $8000 and $BFFF. The cartridge memory is divided into 128 banks, 8 KB each. The last bank is always mapped to $A000-$BFFF. Seven lowest bits of a byte written to $D500-$D5FF select the bank mapped to $8000-$BFFF, bit 7 disables the cartridge.

Type 39: Phoenix 8 KB cartridge

An 8 KB cartridge, that occupies 8 KB of address space between $A000 and $BFFF, and can be disabled by an access to $D500-$D5FF.

Type 40: Blizzard 16 KB cartridge

A 16 KB cartridge, that occupies 16 KB of address space between $8000 and $BFFF, and can be disabled by an access to $D500-$D5FF.

Usage

Use File/Attach cartridge (Alt+C) to run the program on a cartridge.

As soon as you manage to run a raw cartridge image, you can convert it to the CART format for easier use (Misc/Convert/ROM to CART).

I believe that there is a schematic for a PCB add on the web, somewhere,
with 5 or 6 ROM slots.
At least I think that I have seen the schematic.
Good Luck with the Homemade Translator.

Most Atari printers will not print newer characters...a standard printer
with an IBM font is needed.

The RS232 driver is probably set to 20 chars for input and 20 for
output. It manages flow control as the user gets or puts a char to
their own buffer.

Unless set specifically, most printers will not wrap a line at 80
characters, the user has to.

You might want to look at BASIC BBS software such as AMIS or FOREM.
These show you how to manage data and flow control for R:, P:, and D#:.

Small bob guy wrote:

> How do you type codes for Roms?

Normally, Rom "codes" are assembly language instructions and data. You need an Editor and assembler. There are many.

Once the code works in memory, you reassemble at the cartridge address to a disk file and burn the code to an eprom.

The data can be anything...you create it any way needed, sometimes in the assembler.

You can also create the program in psuedo code run with a runtime engine(such as C), all run on the eprom.

As a side note, you can also take a binary image of the actual code and
use a cartridge loader to load it into ram.

If typing it in from a magazine, just use a text editor, save to disk,
the use a cartridge loader.

Thanks, guys, but I'm trying to avoid eproms/firmware. (I do have a Newell
RamRod module that holds three 27128's)
I am just testing these OS's, so it would be much more convenient to use
software to load an OS and test it. So I'm looking for a software utility to
load and switch.

I'm not at home, so I can't check.
I recall a BASIC program that came with the Newell Ramrod disk.
I believe it would put a file OS into RAM and do what you want.
I tried spudster and the Holme's files.
Maybe someone has that Newell disk and could check.
I know it turned off the OS, did some ml stuff, set interupts.
It isn't that hard. You have to turn off VBIs, turn off the
OS ROM in PORTB, load your OS, then turn VBIs back on
and jump to the warmstart. Something like that. I believe
now it was an assembler editor type example listing.

Hi

I am using the MAC 65 cartridge version 1.01 with emulator Atari800Win PLus
4.0
and when i type in a listing and assemble it, LIST D#1:file.src works fine,
but BSAVE #D1:file.obj<0600,0609 saves an empty file... I don't understand,
as my program is located between 0600 and 0609...Does MAC 65 works fine with
the emulator ? Thanks

I assemble in that way:

ASM ,,#D:FILE.OBJ
```

Don't forget the two "," (comma?)

```
You'll make a binary file.

And if you want to make an executable, you can do, for example:

10 .opt no list
20 * = $4000
30 init
40 lda #$1
50 rts
60 ;
70 *=$2e0
80 .word init

Hope to help

What you are doing is simply a binary save, I'm thinking what you
want to do is
asm,,#D1:file.obj
which will assemble the source code you have typed in and place it
in a file which when loaded will load to 0600-0609 address? There
will be nothing else done so if you wanted it run on it's own you
need to add the code to do that.

Well, Atari++ supports two different "layouts" of these Oss modules,
called Oss and OssB. If one doesn't work, try the other. If, finally,
you do not succeed, please mail me privately because then we've a bug
that requires fixing. My Mac/65 works on Atari++ the last time I
tried, at least. (-;

So long,
Thomas

> the emulator ?

1) Mac/65 doesn't assemble into memory unless you tell it to do so with
".opt obj".

2) Mac/65 cannot assemble into page 6. It is required for its own input
buffer. Your program will get simply overwritten.

Try to assemble to disk.

So long,
Thomas

I've used MyDos for many years, and of course, Enhanced Density in MyDos is not compatible with the Dos 2.5 ED. I always used SD or DD, but many ATR downloaded ATR images are in ED. This causes *lots* of problems when I'm trying to copy files from one disk/image in ED to another that is DD. There is also a related problem when copying from a disk (that may or may not be in ED) to an ATR. The only way that I can tell without rebooting another dos is from the sound of how long a track takes to read.

Is there any Dos 2.5 compatible dos (or utility) that will also read/write DD?
Thanks,
Larry

Happy's WarpDos came in two flavors -- Dos 2.0 -- the common version and (OSS) Dos XL -- much less common. Dos 2.0 doesn't understand either ED or DD (unless patched for each). I not sure if DosXL supported ED, but I'll check it out. I have several versions. I also tried SmartDos, but it wasn't smart enough. ;-)

Thanks for the suggestion.

Hi Thomas, everyone! Well guess what. The problem was that the rom image files I had were bad. I found some other files out on the net and they work like a champ so far! Now then... how to "stack" carts together like is done on the real iron? There's nothing quit like an R-time8 topped by a SpartaDOS Xwhich in turn is topped by your favorite OSS cart. I know the R-time is emualted and can co-exist in the emulator withthe others, but what of combining SDX and another cart?

Copyrights only last so long. I know there have been some
(unfortunate) changes in that regard in recent times but some older
stuff has lost its copyright now. The time period was 20 years I
think. Anyway, as to DMCA and happy... The DMCA specifically says
that no part of it shall be interpreted to infringe upon laws dealing
with fair use. In other words, no matter what DMCA says, if any part
of it it prevents fair use as defined by law, those parts shall be
void. That is what the law actually says. As to the courts.... well
anything is possible. Besides, ex-post-facto prevents DMCA from
criminalizing the Happy.

You need SAP plugin for Winamp. ... you can find it here
http://asma.dspaudio.com/bin/in_sap22.exe

AFAIK winamp2 or winamp5 will work with it.

You can also use deliplayer or some windows SAP player:
http://asma.dspaudio.com/bin/sapmp171.exe

Anyway I recommend Winamp with plugin.

I thought computer software has the same copyright rules as books,
movies, music etc, i.e. until 70 years after the author's death
with a few exceptions. Since home computers haven't been around
for 70 years yet, about all copyrights except those explicitely
abandoned (can one do that?) should still be valid.

However, after 20 or even 10 years, most of the stuff has lost
its commercial value except for "trademarks" like the Mario
character or Ultima series of games.

IMHO in many cases the denial of digital redistribution of no
longer sellable items boils down to securing the game concepts
for future remaking and making it harder to convincingly hunt
pirates destroying the current market -- if you allow 20 year
old games to be freely downloaded, why not 10 year old games
and why not 5 year old games and why not 2 year old games and
why not the games from last year?

It wasn't. It happened to me when I was playing the game back then and I was TOTALLY uninformed. The volume was way up and the graphics and sounds were so sudden that I almost fell from my chair. LITERALLY! Of course, the game was lost because the alien smacks the front window of the craft and you die. :-/ This happens when you don't open the airlock in advance. Also, the guy running towards your craft has a green helmet...

Hmm. Currently, only the real-time module allows "stacking" as I
wasn't aware of any other cart modules that would allow that. If you'd
like to give me a list of cartridges that allow "pass thru", I'll be
glad to add proper emulation for the next release (it's in preparation
anyhow....).

So long,
Thomas

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

> character or Ultima series of games.

Moreso than just trademarks. Actual games (via emulation or remakes)
are still popular. See all of the Atari/Midway/Intellivision/Activision
'game packs' you can get for modern game systems. I have plenty of discs
with 20+ year old games for my PlayStation and PS2. I played Road Blasters,
Gauntlet, Klax and Marble Madness on a friend's XBox the other day.
Another friend with a GameCube has the same disc.

Classic games (like Asteroids, Pitfall, etc.) are available for cellphones
these days.

It's not simply a matter of "We want to keep the name 'Pitfall' because
we're going to come out with a 3D version for XBox", but ALSO that they
want to release the ORIGINAL Pitfall, because there's still demand
(from us retro games... the same folks who enjoy grabbing emulators and
ROMs off the net -- often, technically, illegally)

What seems to be an ironic twist is that the folks doing the software
development of emulators for modern systems often base their work off
of the same software that's being written for free to emulate the hardware.

The Activision Atari 2600 game disc for my PS2 is actually based on "Stella!"
(Check the credits)

Note: IANAL and IANAEE (I am not an emulation expert)
;)

Thanks Bill.

In principle, this "stack" can be even expanded by a suitable "right cartridge"
for the A800.

Are you aware of any additional cards with a "pass thru" slot?

So long,
Thomas

1002. OSS Compatible BASIC

Newsgroup: comp.sys.atari.8bit
Date: 2004-03-02 12:59:55 UTC
From: Stephen <sdlnospamar@comcast.net>
Message-ID: <4044854B.66CE576A@cast-com.net>
Source record: 16808

Hello,

I'm toying with the idea of building
a version of BASIC that would ultimately be
compatible with OSS's BASIC XE or BASIC XL.
I'm curious if there's any interest in the
Atari community about something like this,
or if this has been attempted before (nothing
show'd up with Google).

I know there are _many_ fine emulators
out there already, and anyone who wants to run
a BASIC program can do so as if they were
running on actual hardware.

But, I'm talking about writing this in
C/Unix and using X windows (hopefully allowing
ports to other graphic architectures easily)
- not a 6502 emulator.

Naturally, the initial objective is to
fully support existing BASIC programs at their
save'd level (and list'd level, too). One big
item I don't think would be practical to support
is the USR function. Hybrid programs are best
run in one of the available emulators. However,
I'd try to support many of the common
PEEK/POKE locations.

The real emphasis of the project would
be the language itself - not an Atari H/W
emulator. Having a natively written OSS
compatible BASIC would be interesting (and fun).

Besides running existing BASIC programs
really really fast (compared to emulation),
some of the original limitations could be
put aside - how many times have you caught
yourself wishing that the original Atari's
had 8-bit (or deeper) color? Or more than
38/40-columns? More _modern_ graphics
statements beyond PLOT/DRAWTO? Etc.?

I think this is a non-trivial project,
but I think there might be merit in it.
I'm not talking about building a VB type

of BASIC either. This version would still
be an interpreter in the manner that the
Atari BASIC(s) interpreted their source.
I though of BASIC XE in particular because
that was designed to be extendable (statements
only, if I remember correctly - though
I don't think it was ever documented)
and I thought keeping that model (of course
in modern terms using shared libraries, etc.)
would be a good starting point.

I welcome any suggestions, comments, etc.

Stephen Lawrow

1003. Archiving old magazines on website

Newsgroup: comp.sys.atari.8bit
Date: 2004-03-02 16:15:09 UTC

Source record: 16809
Cross-posted to: comp.sys.apple2,comp.sys.atari.8bit,comp.sys.cbm,comp.sys.amiga.misc,comp.sys.ibm.pc.classic

Hello all,
I recently started looking into archiving old computer magazines on a website. One of my favorite magazines was Compute!, as well as some of their books. But there are other magazines out there as well. Personally I am a long-time user of the Apple II series, but I wanted to inquire to users in these groups that have other computers as well, to see if there was a broad interest in this. I would think there would be a use for having some of these old publications in digital format, online.

I own a web hosting and design company, so I have the means to do this.

I understand there are still some existing copyrights to some of these out-of-print publications that need to be adhered to. But I have already started looking in to this on some.

Anyway, I'd like to hear what others have to say about this, and if there is a demand for it. I'm willing to pursue this further if there is a demand.

Thanks a lot for any additional comments/feedback....!

> #d: works fine as well as all the games...
>
> Thanks again !

Did you take the advice not to use the bottom of page 6? You should org
it at $680 or so the cartridge does not step on itself.

Fuzzy because I haven't had my first cup of coffee so...

IIRC if you use DDT even $680 may not be enough. One of the reasons I
used the Atari asm/ed cart for short routines.

I think Mac defaults to decimal, so make sure you are using $680 vs. 680.

You pretty much have to adjust to the way MAC works instead of trying to
get it to work like you want to. Wilkinson actually said ~'an
assembler that defaults to assembling to memory is a bad idea' for instance.

#1 is forget about using page 6. This forces you to learn the different
memory commands and using .org(s) >$2000. You may even start using a
programming disk with a MEM.SAV on it. There is a reason why all those
programs in the Atari magazines had $4000 for their .org(s).

#2 is think of it as a disk based assembler, at least for output when
you are done with coding.

#3 just consider its speed/benefit is as a code checker vs. assembler
until your code is ready to run. I always thought of MAC as the
assembler to use for big projects. When you assemble from disk to disk
it can handle huge projects and do it quicker then just about anything else.

There are probably copyrights to all of them. Copyrights today last a long time.

> But I have already started looking in to this on some.

It could be a problem to track some of them down, since many of them have
gone out of business.

My Grandad bought every issue of Compute and Compute Gazette and had them
delivered from the US to the UK. About a year ago he threw them all out. I
nearly cried when he told me what he had done! I would love to see a web
archive of these brilliant magazines !

Much of the Commodore stuff is already being
archived. About the only journals that I have
needed but couldn't find were RUN and TRANSACTOR.

The copyrights for these may be actively enforcied by
their owners or nobody sees a need for their archives.

You may want to check out ARNOLD or QLINK to see what
already exists. My HP is terminally ill, and the public
library internet system doesn't like arnold or qlink.
Somebody else will have to provide the site address details.

Hello Bob,

As I understand it, there are several ways to do it.

Why not talk to the sysops who are already doing it?

Please be aware that some are doing it in emulation on a PC and some
are interfacing a real Atari 8-bit to a PC to do it. Both approaches
work from a caller's point of view.

Here are a few telnet addresses. Drop the sysop a line. You should
get a response:

telnet://cth.dtdns.net

telnet://bfbbs.dtdns.net

telnet://213.10.214.144:8888 or telnet://213.10.214.144:8887

There's one more that I have, but he's still testing.

Take care.

Alan

Amstrad Action magazines are being archived at:
http://www.cpcoxygen.net/

Future Publishing seem fairly good at letting the old magazines be
archived in such a way....

Hello Raj,

> Of course now I don't *remember* who is the current owner. But I do

I know that CMD obtained the rights to RUN (and therefore Commodore Magazine which RUN had obtained). Since that point, I would imagine that the rights have either passed to Maurice or possibly either GO64! or Centsible Software.

Centsible Software is reportedly the place to obtain back issues, and GO64! fullfilled the remaining subscriptions for Commodore World after CMD ceased publication.

So, I would venture to guess that the current RUN copyrights probably rest with one of the 3 people / companies mentioned above.

You can find information about the 3 possible owners at:

http://www.cmdrkey.com
http://www.go64.de/
http://www.centsible.com/

As for my two cents worth, RUN and Commodore Magazine were my favorite publications. Compute! and Compute's Gazzette were also right up there at the top. I still have a large collection of these magazines that I read and reread frequently to gleam new pieces of wisdom from their text. It's amazing that every time I read them, I pick out new pieces of information that I missed the last 20 or 30 times ;-)

I for one would favor a legal online source of all the articles and / or disk issues for the above mentioned publications.

For those interested in obtaining permission, I would contact the sources mentioned above.

Michael Hunter

Definitely people want to see this sort of stuff!

For the Apple II line, not much is really out there.
As far as I know, there is:

(1) Call Apple
available for purchase as PDF's from www.CallApple.org

(2) Nibble Magazine
available SOON from www.CallApple.org (being scanned now)

(3) Hardcore Computist / Computist Magazine
available at computist.textfiles.com

A couple good Atari sites include:

http://www.atariarchives.org/
http://www.AtariMagazines.com/

The neat thing is too, that the SDX cart has the ability to turn off
and on the cart stacked into it. For that matter, SDX comes with
programs which can turn on and off the SDX cart itself. Convenient
for a real Atari if you don't want to have constantly physically
plug/unplug different carts. Less useful for an emulator as plugging
or unplugging is a matter of a quick configure.

Source record: 16831

I'm looking for the "Homemade Translator" source code from ANALOG (07/85). I have the BASIC "creator" program, but I need the Mac 65 source, since it needs to be patched in a few places to make it fit my needs. I have the mag and can/will key it in, if necessary, but if anyone has the source code file, please email me. I tried scanning, but the print is small and it does not OCR well, at all.
Thanks,
Larry White

I admire your enthusiasm, but I fear there wouldn't be much interest;
even among old die hard BASIC XL/XE fans. Here's why I think so:

1. Most programs written in it, even most simple ones, use hardware
specific features. As you say, USR, but even things like any graphics
or sound fit this category. Only basic text input and output and
mathematical processing could be used within this model.

2. Those that have the skill to heavily modify programs to work out
would then be subject to #3.

3. There are already really good program development tools for modern
platforms. BASIC XL wouldn't really add anything. Those who can
program would I think choose these tools over a BASIC XL style tool.

Just my take on it.

PS: are you the author of Mac/65?

If you make a good faith effort to contact the last known address of the publisher in order to request permission, and don't get a reply, you're probably safe to put the material online. Even if someone else owns it now, and notices, the most they'll be able to do is send you a Cease and Desist letter.

Likely not even that. With no possible way to show they've been "damaged" (in a monetary sense), it wouldn't even be worth paying a
lawyer $20 to send a letter. Now, if the owner were selling, or willing to sell back issues, or CD's with scans of the back issues,
then they'd have a monetary damage argument. Not much of that going on though ;->

IIRC, There were three good articles in Z-Magazine about basic copyright law. The last was the best and probably the most informative. My recollection is that most copyrights have a base period of about 75 years, but like the lawyers always say, "it depends"...

Copyright law has changed over the years. The original US copyright laws (from over a century ago) provided for a 14-year term with the possibility of a renewal for another 14 years. (See http://creativecommons.org/projects/founderscopyright/ for details.) Over the years, though, that term has been extended again and again at the behest of publishers and other copyright holders. (Disney's been a big factor in recent extensions -- think of "Steamboat Willie" from 1928; if/when it falls into the public domain, Disney loses exclusive control over the very lucrative Mickey Mouse character.) Currently, US copyright length is 70 years past the original author's death, or 95 years for copyrights held by corporations or for works published before 1978. This current term is the result of the "Sonny Bono Copyright Term Extension Act" (See http://en.wikipedia.org/wiki/Sonny_Bono_Copyright_Term_Extension_Act for details), which was quietly passed and signed in 1998.

Of course, copyright terms do vary from one country to another. Most countries, though, have signed the Berne Convention, which holds that copyrights must be at least for the author's life plus 50 years.

Personally, I think the current length of copyright is absurd; even the Berne Convention's minimums are far too long. We're actually losing parts of our culture as older works are lost, forgotten, or simply not distributed to people who might be interested in them because they're long out of print. Currently, the only proposal I'm aware of to reverse this tide is the "Public Domain Enhancement Act" (http://homepages.law.asu.edu/~dkarjala/OpposingCopyrightExtension/legmats/hr2601.htm), which aims to require a $1 registration fee after 50 years and every ten years thereafter to maintain a copyright. The goal is to let older abandoned works fall into the public domain rather than be lost completely. I haven't checked on the status of this bill recently, though;

it may well be dead by now. Still, if you're interested in this matter,
you might want to write to your Congresscritters.

Cross-posted to: comp.sys.apple2,comp.sys.atari.8bit,comp.sys.cbm,comp.sys.amiga.misc,comp.sys.ibm.pc.classic

The Atari community is WAY ahead of us when it comes to creating
online archives of relevant materials. Check out the following:

http://www.atariarchives.org/
http://www.atarimagazines.com/

The first one includes the full text of several books published by
Compute! so I would ask them how/where they got the rights. The second site
has indexes of Compute! and Compute!'s Gazette and I remember hearing that
they intended to put the entire collections online eventually. Checking on
the progress of that endeavour might be wise.

I would very much like to see similar websites for Commodore books
and magazines and since some of the content at AtariArchives is relevant to
Commodore (like Machine Language for Beginners) I would hope they would be
willing to cooperate and share texts.

Yes, my name is Bjorn and no, I don't work at Ikea.

1033. Re: Enhanced Density Question

Newsgroup: comp.sys.atari.8bit
Date: 2004-03-03 19:45:01 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <404635BD.F69C4D43@students.uni-mainz.de>
Source record: 16840

Well,
MyDOS can read Atari DOS 2.5 enhanced density disks completely (but only read - not write; at least not writing farther than sector 719) and of course it can also read/format/write DD up to 65,535 sectors. So, where is the problem ?!? On the other hand you can also try Turbo DOS (by Reitershan / Germany), Bibo-DOS (by Compyshop / Germany), Super DOS (by Paul Nichols, Australia), Mach DOS (by ???, US or UK I guess) and other DOS versions to read DOS 2.5 ED disk-files and write them on DD disks. Of course there are -as always- some diskfiles that will not load under DD...

The other way around is not so nice - there seems to be no DOS version that can read MyDOS ED disks and write them on DOS 2.5 ED disks. Thus, the only way is to copy these files with MyDOS onto SD or DD first and then copy them back with another DOS to DOS 2.5 ED format...
greetings, Andreas.

P.S.: Afaik MyDOS has some problems when using only one drive as source and target (from time to time the copy option hangs up, even if you have a drive with auto-density-detection), so better use two drives or Drive 1 and Drive 8 / Ramdisk (if it is big enough)...

LarryWhite schrieb:

1034. Re: Enhanced Density Question

Newsgroup: comp.sys.atari.8bit
Date: 2004-03-03 19:57:15 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <4046389B.563B6853@students.uni-mainz.de>
Source record: 16841

Well,
- Smart DOS - SD and DD only (with manual density toggle), no ED...
- Top DOS - many formats, but not DOS 2.5 ED compatible I think to
remember...
- (Happy) DOS II+D version 4.5 from german magazine Happy Computer does
SD and ED, but ED is not DOS 2.5 and not MyDOS compatible...
- DOS II+D version 6.x does SD, ED and DD - but ED is not DOS 2.5 nor
MyDOS compatible;
- DOS XL older versions are only SD, newer ones can do SD and DD (but I
have not seen any DOS XL which could do DOS 2.5 ED)...
- DOS XE by Atari can do SD, ED, DD and DSDD - but to me it seems to be
DOS 2 incompatible (like DOS 3, DOS 4 and Sparta)... written by the same
guy as DOS 3 it has the same disadvantages...

So, if you want to have DOS 2.5 compatibility use Turbo DOS, Bibo-DOS,
Super-DOS, XF-DOS, Mach-DOS and a few other DOS 2 derivatives. Yep, ED
is the format with the biggest compatibility problems. Most DOS versions
made their own choice there. But nowadays there are quite a lot of DOS
versions and utilities available (at least here in Europe) that are
compatible with DOS 2.5 ED, so whenever I have to choose ED format I use
DOS 2.5 ED format... -Andreas.

Yep!
the same thing happened to me... really funny....

On the other hand: What do you have to do in Koronis Rift ?!? I never found out, allthough I did have an original version with manual. Was it really your goal to collect all items/specimens you found and then a) keep them or b) sell them...?!? I always kept a few items and since they helped me in no way, I soon decided to sell everything I found. This way the game got boring after a short while...

so again, what to do there ?!? Make all the Rifts empty - is that all there is to do ?!? I have not found any item that made my "car" (tank, hovercraft,... whatever it might have been) faster or that gave me better weapons or such... So, why should one keep the items ?!? And furthermore what`s it good to sell the items ?!? Do you get money or what ?!? What to do with the money then ?!??? Ok, after all I did not like Koronis Rift. The same fractals as in Fractalus (but green instead of brown) and for me a rather boring gameplay... -Andreas.

Message-ID: <40464082.DA093B3D@students.uni-mainz.de>
Source record: 16845

Well,
there already has been a "Battle of the Basics" in the past - or
otherwise said, we already have enough Basic interpreters (though some
od them are hard to find):

- Atari Basic Revision A, B and C
- Microsoft Basic
- Microsoft Basic 2
- Advan Basic
- OSS Basic (various versions);
- OSS Basic XL
- OSS Basic XE
- Turbo-Basic (type-in listing, by HC thus PD status!)
- Hypra-Basic (from Compyshop magazine, PD!)
- Fast Basic (by Tom Hunt? PD!)

and Basic Compilers, like:
- ABC by Datasoft
- MMG compiler
- Synergetic Software Systems Basic Compiler
- Advan Basic Compiler
- Turbo-Basic Compiler (PD! also compiles Atari Basic);

and a few more which I do not remember right now. Me, I would like to
see a PD Basic and/or Turbo-Basic compiler, that creates a "stand-alone"
ML-file like the ABC and MMG compiler did (ok, its actually the Runtime
and the compiled file appended to one ML file)... It is a little
awkward to load the CTB-Runtime every time you want to load a single CTB
file... The PD compiler should only speed up the reading (and poking) of
Atari Basic Data lines, since they take the most time among old Basic
listings... -Andreas.

P.S.: If you still program a new Basic interpreter, let us know,
anyway...

Showing harm is only a civil action concept. Copyright law is
statutory and therefore a criminal matter, where there is no
requirement to show harm. Criminal proceedings are only required to
show that statutory copyright law has been violated. But again, I'm
no lawyer so take that for what it's worth.

For example, if you go into a tavern, break bottles and start
threatening harm unto the customers it is likely you will be
prosecuted for assault. Now if all or most of the customers bail
before you are apprehended the proprietor could take you to civil
court for the harm of lost profits on a busy night or future lost
business. That's the harm required to show for civil court. The
people only have to show that you committed the act of assault
(threatening physical harm) without regard to the taverns profits.
Two different issues.

O.K. :-) I stand corrected.

Anyway, the point being that there is so much information packed into
those magazines that you often cannot absorb it all at once. I've
reread them many times over the last 10 to 15 years, and still find
new things that I must have missed the last time.

Hi Andreas-

> Well, MyDOS can read Atari DOS 2.5 enhanced density disks completely (but only read - not write; at least not writing farther than sector 719) and of course it can also read/format/write DD up to 65,535 sectors. <

This is from memory -- MyDos does not read the 2.5 ED "second VTOC". If you put a Dos 2.5 ED disk in a 1050 using MyDos, you will not have any idea if the disk is SD or ED. MyDos uses more bits for its sector counts, so it doesn't need to resort to the tricks (kludges?) that 2.5 went to.

MyDos will happily format and write out 1040 sectors (using the "A" response to the format query), but not compatible with 2.5 (unless just sector copying).

And there's my problem -- I take a disk from my collection, put it in my drive using MyDos, and what size ATR do I make? If I use Dos 2.5 then the next disk I pull out of my collection is likely to be DD -- oops!

Certainly there are ways to find out, but switching Dos's every few disks is a pain -- hence my question. Thank goodness the APE's ATR's show the disk characteristics.

Thanks for the suggestions of some of the other Dos's to try. SuperDos might just do the trick!

Regards,
Larry

To answer my own question... I found this in the Atari ++ emulator
documentation:

As a bonus, the emulation also includes Matthias Reichlï¿½s ï¿½atarisioï¿½
interface, allowing you to connect a real 1050 or 810 drive to the
emulating PC by means of a 1050-to-PC or ProSystem cable.

Anyone tried it?

Well, I, at least. (-; (Now, that's obvious, isn't it?) though not
with a real 1050, but with a second PC and an AtariSIO server running
on the second PC. Note that AtariSIO is for the *ix version only.

So long,
Thomas

I agree. I have a collection of old Compute!, Compute Gazette,
BYTE, Creative Computing, Computer Language, Dr. Dobb's, and
others...and often dig for articles containing certain info.
ISTM that the respective companies dropped the ball when
they failed to offer the collection on CD-ROM.

(Heck, I even have a few issues of Interface Age...)

Yes, it should be. This was a typo...using "gleam" for
"glean" seems much more likely to be misuse of the terms.

What I posted was just a "nit" that I wanted to "pick".
To me, "gleaning" implies that you go over the text
in a thorough manner and *not* even the smallest nuances
and twists of knowledge can escape you.

1058. Re: OSS Compatible BASIC

Newsgroup: comp.sys.atari.8bit
Date: 2004-03-04 15:33:44 UTC
From: "Stephen L." <sdlnospamar@cast-com.net>
Message-ID: <40474C58.6230C8D3@cast-com.net>
Source record: 16715

Hello,

I appreciate the responses I've
received and I'm researching the list of
BASICs Andreas provided (+ the ones listed
in the FAQ). I believe that all of these
run on a 6502 - are there any that run
natively under C/Unix?

Primarily, I'm keeping the BASIC
compatible with the Atari/OSS model
because I believe that's what most of the
legacy BASIC programs were written in
(even un-published ones).

-> SgtSilicon:

1. I think its possible to provide
enough "hardware" support to make
it worthwhile. I admit, though,
I don't really know how many
BASIC programs rely on the USR
function to provide a significant
part of their functionality (I know
the PEEK/POKE can be dicey, too).

Existing hybrid BASIC programs which
rely on the USR function can run in
one of the emulators available.

2. Not every has the skills or the time
to port a BASIC program to another
more modern architecture/language.
It might be beneficial for these
individuals. But, see #3 ->

3. This is a hobby effort on my part.
If it get to be impractical or ugly,
I'll abandon the effort -- it's possible
nothing may come of the idea.

I'm not really thinking of
developing a _new_ programming
language. I agree that there are
many better alternatives to Atari
BASIC for new program development
on the newer hardware available.

I'm not sure if any of these have
the simplicity/elegance that these
olde BASICs had. (But to be fair,
these _had_ to have this quality
because of their limited resources
available to them - let's see Perl
fit in 8 kilobytes!)

I thought about doing this with Action!.
But, 1. I'm not as familiar with its
inner workings, and 2. I don't believe
there were many products produced
with it (commercial or share/freeware).
And finally, 3. there's a special
place in my heart for Atari/OSS BASIC
(mushy violin music okay here).

It will be an interpreter, because
I think that's the easiest way to
implement the language and add
extendibility at the same time.

> P.S.: If you still program a new Basic interpreter, let us know,
> anyway...

I don't expect to have anything
too soon, but I'll definitely post anything
of interest to the group.

Again, thanks to the individuals
that have replied.

Now, see, that's another place where I have a problem with
copyrights. ISTM that the enforcement of copywrite *used* to
be a civil matter, and *not* a criminal one. ISTM that it is
only with the recent draconian copyright laws (the last
several years) that enforcement of copyright came into the
criminal court domain...

1061. what is basic like now from a ATARIBASIC perspective?

Newsgroup: comp.sys.atari.8bit
Date: 2004-03-04 17:20:04 UTC
From: "|<evin" <nospam@nospam.org>
Message-ID: <e0pe40tb3lv54i166od7ug3ufq0e9ervu1@4ax.com>
Source record: 16718

I havenot touched a basic language in years. In the early 90's I learned C, and later fiddled around with Java but niether really held my interest. In the 80's I wrote huge (at the time) telecommunications programs using the "T:" handler for my 1030 modem (if anyone remembers what that is) and had lots of fun modifying various bbs programs etc...

anyway, my question is; what is basic like now? With the speed of my XP computer I can think of some simple programs that I could whip up in basic to do lots of stuff, but would it basically be like learning something completely new? How would it compare to Atari Basic?

thanx in advance

kvn

Hi. Well I did want to answer your request for input honestly, even if it did turn out to be less than enthusiastic. I guess from my perspective something like that could be cool, but I just fear the effort you would need to go through might be a lot. As long as it's just for fun why the heck not . ;-)

And by the way: I have always really admired Mac/65; great job! I think it's one of the best assemblers ever made for an 8-bit computer. Not unlike the tradition of other O.S.S. languages like BASIC XL for example.

True, true. The criminal side of copyright law is a pretty recent
thing. I agree with you that copyright should be really just a civil
matter. I mean, even patent infringement is still civil only I think.
But one needs to only look at who the politicians really work for.
Notice that former senetor Mitchell just got the Chairman job at
Disney? I'm sure that appointment is all based strictly on a
confidence in managerial skills and vision, and nary a thought to
provide welath in return for favorable votes in days past. Anayway
I'm rambling now about something not related to computers or Atari.

ciao

Hello Thomas! I have a real 1050 hooked up via one of Steve Tuckers
Prosys cables. I have it plugged into com2 on my PC. I am running
the Windows port of Atari++ emulator. How do I make the 1050 work
with it? Is it possible or is it only for the 'nix version at this
time?

It's a great idea. What I'd personally like to see are complete scans
of these old magazines made into PDF-files. In that way, you can
download an entire magazine and read at your leisure, or even print it
out.

> as my program is located between 0600 and 0609...Does MAC 65 works fine with
> the emulator ? Thanks

According to the MAC 65 book:

page 6 is not free(page 77)..in fact best to use ram above the user program Use Size.(page 22)

BSAVE uses hexnumbers by default, no $ needed.(page 12) But it could be wrong since the section on numerics specifies the $.(page 34)

Since the resultant file was empty, I'd think the $ was not needed. Its a buffer overwrite problem as has been mentioned.

> I'm currently using XFormer2000 by Darek Mihocka. Is this the best one
> to be using?

I'm running it on real atari 8bit equipment, but that takes lot of money. If you only have atari 8bit and sio2pc (no harddisk) you do not want to run a BBS on real atari equipment.

If you want to run it on emulator, you should try to run it on a modified version of atari800...

There is something strange in the telnet emulation in atari800win and atari800. It does not handle DTR/DSR/CD right, so good bbs software won't recognize a user has dropped the connection.

And ofcourse you'll need atari 8bit BBS software...

Marius

1072. BBS THE ATARI INSIDE IMPROVED

Newsgroup: comp.sys.atari.8bit
Date: 2004-03-05 15:46:37 UTC

Message-ID: <c2a7mqrif1@reader08.wxs.nl>
Source record: 16729

Hi folks!

It has been a few weeks, since I wrote about my BBS. There are some improvements.

The BBS is running stand-alone now on my 800xl. No PC is needed anymore! I have connected a LANTRONIX MSS-100 to my BlackBox and that works fine (after many hours of hacking the bbs... but ok)

(!) When someone is on the BBS, your telnet client can't resolve the adress. I'm sorry for that. When nothing crashes the bbs will never be down, so when you can't get a connection, please try later...

There are two adresses with different possibilities:

telnet://213.10.217.144:8888

* VT100/ANSI telnet works perfect!
* Any non-atascii telnet client works fine
* UP/DOWNLOAD works fine with HyperTerm

telnet://213:10.217.144:8887

* ATASCII works perfect!
* UP/DOWNLOAD fails! (please do NOT try to up/download, the bbs might crash)

If you don't want to up/download port and you really like to get a 100% perfect atascii connection. 8887 is the port to use.

Thanks,
Marius

I have had very good experiences with turbodos. As far as i know it is
freeware now.

Since I have a harddisk I only use spartados. It is the very best harddisk
dos ever written on atari 8bit.

You should really give that one a try. There is an extremely good
game/demo-loader available that runs about 99% of al the binaries. Imagine:
16mb atr loaded with games and demos. ... that's how I run it on ape.

Hi Marius-

> I have bought a complete new computer system, and with this computer and xp and ape the problems are even worse... <

How fast & what kind is your new CPU? When I went from a 1.3G Celeron to a Athlon 2500+ (1.9 MHz, actual) I had the same problems. Steve worked very hard and succcessfully to get that fixed! I still can't print with APE, but disk transfers are fine at 1X and 3X, again. If you haven't already, check out DosPrinter V8.06.
Take care,
Larry

I think it would be nice to do that. I for one loved Compute have
all the Atari ST issues and disks. Too bad they did not carry the
Atari line much longer than they did.

You can connect with atascii:

with ATS (http://www.atarimax.com look at the bottom of the page)

or with APE + atari 8bit computer + sio2pc cable (http://www.atarimax.com)

or with REAL atari 8bit equipment + lantronix (http://www.lantronix.com)
device server + R: interface (like the 850 or the blackbox)

I own the copyrights on all the articles I wrote for The Apple IIGS Buyer's Guide, inCider, inCider/A+ and of course Shareware Solutions II. And, quite frankly I don't want those articles out of my control or sight.

I would not authorize you to put them online.

If and when those ever do go online, it'll be on my site, and in my own good time. But, thanks for asking.

One consideration about putting articles online that I'd never even thought of until recently...Apparently, my articles made me "an expert" of sorts, and I can't tell you how many attorneys have contacted me in recent months, sniffing around, asking questions, from everything about names of companies to info on online compression schemes....and it's a PITA. It'd be even worse if my articles were online.

Joe Kohn

I'm re-visiting Brian Moriarty's 'Crash Dive' from ANALOG.
I remember to hold my breath and open the hatch.
I have to retrieve the radioactive sonar unit.
I'm stuck getting the unit. I get the suit, shampoo and wrench, but can't
get the unit. I pour the shampoo, but I can't remember how to get the unit.
If I recall, once I got it, it seemed very odd how you accomplished it.
Larry Richardson's docs, hints and solutions is gone, wish I'd of downloaded
that whole site.
Anybody remember how to get the unit?
Thanks

1082. 800xl vs. 130xe

Newsgroup: comp.sys.atari.8bit
Date: 2004-03-06 18:17:06 UTC
From: Slor <abuse@abuse.net>
Message-ID: <Xns94A487258C1BFemuslor@130.133.1.4>
Source record: 16739

I currently own an 800xl, and I'm considering adding a 130xe to my collection. Before deciding to do so, I have a couple questions:

1. Besides the doubled memory, are there any major differences between the 800xl and 130xe? I'm curious whether the keyboard is more responsive or if there are any architectural differences I missed while looking for info on the xe.

2. What's a reasonable price to expect to pay for a mint condition 130xe? I haven't bought any hardware recently, and I'm haven't seen any in extremely good condition on eBay (i.e. rarely used, no keyboard yellowing, etc.)

Thanks!

The XE keyboards are the worst Atari ever produced (if you don't count the membrane of the 400). IMHO best to worst:

1200XL
800
600XL/800XL
130XE
400

Keep in mind on the XLs, I have seen variations in quality. Quite honestly, I would simply upgrade the memory in the 800XL to 256. It might not have the Antic mode for the extended memory access, but that is so rarely used. I have a RamboXL upgrade and it's great, 256K. There are other mods also. Check around for plans or check one of the remaining Atari8 vendors for a Rambo or Newel or something.

no, except the expansion port on the back is somewhat different.

>2. What's a reasonable price to expect to pay for a mint condition

I have a mint condition 130XE, with manual, power supply, and monitor
cable. I will sell it to you for 50 bucks.

Personally, I like the 130xe (I have two) but looking back I agree
with the previous poster that the A800 had the best keyboard.

if interested in the XE contact via email :

What everyone else said and video output on a 130xe is light years ahead
of the 800xl.

The 130 has a nice footprint, kind of neat to have in front of you. Some
people even like its keyboard.

The cartridge slot is in back. Makes stacking carts like SDX a bit of a
PIA to use.

The extra memory is really nice compared to a stock 800xl. For both,
they really need >192k ram disk to get the most use out of them.

Hi Slor-

> I currently own an 800xl, and I'm considering adding a 130xe to my
>collection. Before deciding to do so, I have a couple questions: ... <

The going price on eBay for a good, working XE seems to be $30-40. Used from Atari sellers -- maybe double that. Of course, the preceived risk/value of eBay vs. Atari sellers has been posted here ad-infinitum. You can still buy 130XE's NIB from B&C for $150 (or $95 for NIB 800XL's).

I bought two used XE's for $35+post. a year or two ago. Both work prefectly and were cosmetically great. In my experience, the cases on XE's don't yellow nearly so badly as XF-551's. Yes, keyboards are the weak link. I don't mind the "feel", but they do crap out. But if you get a good one, they seem to last forever -- my original 130XE (~1985) is still going strong.

In the XE, everything is soldered, traces are teeny, tiny -- no fun to modify. OTOH, if you don't mess with 'em, the soldered chips are a "plus" for reliability. As for compatability, there are a couple of demos that I've run across that won't run on anything but a stock 130XE, but overall, it is not an issue vs. an upgraded XL.

As for the 800XL, when last I checked, Best Electronics was still selling the Whiztronics (sp?) 256K board for the 800XL. This is supposed to be a "Rambo" clone. Then there is a not-too-difficult DIY upgrade to 512K. 800XL's are definitely easier to modify.

If desk real estate is a factor (it is for me), then you can't beat an XE. And if you want "plug and play" extra memory, the 130XE is the only way to go. If you have a HD, then the memory/ramdisk is not quite so important, and vice-versa.

Larry

Just ignore copyright until someone sends you a cease and desist letter
(which no one will) then remove their shit but keep everyone else's.
This method is 100% safe.
I've seen a lot of these old computer magazines in charity shops. They
also have lots of those "Write Games on Your Micro!" books with BASIC
code for crappy text adventures. Haha.

It's a good idea as I would enjoy seeing magazines put out there
again: Incider, A+, Incider/A+, Compute, even oldies like the OLD
Electronic Games magazine.

As long as copyrights are observed, I think it won't be a problem.

I always wish I didn't get rid of some of my mags a few years back,
but I really had no place for them.

I am surprised with the advent of lots of 80's nostagalia via video
games, emulators, etc, etc. that some magazine publishers haven't put
out CD's with the magazines on them. I'm sure there would be some
demand. One can hope for a complete set of Apple II or other classic
magazines on CD. :D

I know pdf is a popular format, but unless there's a pdf reader for
Apple, (or Commodore, Atari, T.I., TRS-80, etc.) I would suggest a
format our old machines can read. I just fled from a pc xt and won't
be going back; there are probably many out there who still have and
use the real thing, (even some who, unlike me, had sense enought to
stay away from the junk!) and would like to read the magazines on
there favorite computer instead of the one they "have to have for
business/internet/whatever".

I suggest GIF. It's an old format, and I know there are readers for
the CoCo 3 and C=64/128, probably also Apple.

If you have the recources, it would be nice to do both, but I know
that takes a lot of space.

Acrobat (pdf) format is convenient and makes the information
available. IMHO it is *much* better than *not* having access
to the information at all. Making the information readable on
older machines should be a separate project IMHO.
>

You end up with *lots* of separate files for the same issue of
a magazine. pdf at least allows combining the pages.

Okay, so which format is best for using a search engine with?
After all, it could save a lot of time being able to zero in
on that one article (in WHICH magazine?) that rare piece of
information is being stored.

Really? they don't have to aslk you to "cease and desist" they could just sue you without first giving you the opportunity to comply. You'd already have committed the offence so you'd have to pay up when it came to court. So certainly not 100% safe or risk free. Likewise you can't say that "no one will" (are you psychic?). Joe's post in fact shows that there are authors out there who would object.

Honestly you'd be better checking your facts before posting than wasting time and bandwidth with ascii pictures.

1109. Re: APE Printing and Win XP

Newsgroup: comp.sys.atari.8bit
Date: 2004-03-08 12:16:16 UTC
From: llppwhite@aol.comnsp
Message-ID: <20040308071616.15108.00001088@mb-m18.aol.com>
Source record: 16766

Here is another possible work-around for this issue. It is the Antic Spooler
from the May, 1988 issue.
www.atarimagazines.com/v7n1/anticspooler.html

Fortunately, Antic published the M65 source code, and in fact solicited patches
for the utility. Is anyone aware of any subsequent patches?

Since the APE/XP printing issue seems to be a (too fast) timing issue, slowing
down the spooler to send blocks of code more slowly should be doable.

Larry

Just the fact that there are 2 or 3 people here who seem to hate Ben, either because of personal matters or just because they are the typical Unenet-phenomenon of people who are so annoyed with bandwith wasted on adverts, that they'll happily write ten posts in reply to express their grief.

Like the neighbour who keeps talking to you at your door for half an hour, explaining why (s)he doesn't have time to come in for a chat for 5 minutes. :)

Maurits.

If you want it to be indexed by Google and friends, it needs to be either
well-structured HTML or plaintext. Getting to those from scans, though,
means either OCRing and lots of proofreading. On the other hand, you would
have much smaller files that could easily be handled by vintage hardware.
(Writing something for an Apple II (or whatever) to parse and display just
enough HTML to read these files wouldn't need to be too tricky; it doesn't
need to have all of the functionality of your average web browser to be
useful.)

Hi,

The acount you can use for this FTP server is NOT anonymouse.

Look in the 8-bit FAQ for details.

Secondly in a few days the FTP server will be down for a while. Can't tell
you when it's up and running again.
I will post it here when it's back!

I am currently looking at HTML and searchable PDF (text behind image).
The HTML is text which could be searched easily, with a search engine.
PDF files can also be searched if they are text behind image. I am
assuming most people today have a PC or Mac with Acrobat Reader.
However, converting PDF images to other formats isn't too bad, as it can
be automated. GIF is a good alternative.

I have done a test on one magazine and am getting about 95% of the
entire magazine OCR'd successfully. The articles OCR beautifully, but
the other ads and less important stuff isn't being OCR'd very well.

I really appreciate all of this feedback, and any more on the way!!!

And I'll say it again...it sounds like a *separate* project.
The hardest part of the ASCII project is OCR'ing the articles.

The hardest part of the PDF project is just scanning in the
magazine pages...IMHO.

1125. Re: Enhanced Density Question

Newsgroup: comp.sys.atari.8bit
Date: 2004-03-08 19:57:40 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <404CD034.180D367D@students.uni-mainz.de>
Source record: 16782

Aha,
so you do not want to convert DOS 2.5 ED disks into another density,
but create ATR`s from them. No problem: I use Mycopier! a sector copier
that can read/write/format SD/ED and DD. It has an option to toggle ED
on or off (or to be more precise you can press "E" to togle between off,
auto and on; alas the auto option seems not to work fine, so I always
use on). The fine thing about that: Whenever you give Mycopier a disk to
read or write, simply switch ED to "on", then it will first try to read
sector 1040. When it gets an error, it will detect automatically that
the disk is SD or DD; when it gets a "good" status, it will detect the
disk as being ED (no matter if it is DOS 2.5 ED or MyDOS ED) and read/
write all 1040 sectors (even empty sectors)... E-Mail me, if you are
interested in this program, since there are several versions of it and
they all have the same name and alas the same version number.

The newer versions of Mycopier! do not have this ED density toggle
anymore (they have some sort of auto-detect-density built-in). But there
is a fine thing about that ED toggle-option in Mycopier! - whenever an
ED ATR image is 120k-150k big (and not 130kbytes as it should be), most
DOS versions and sector copiers think the image is Single density,
ouch... With Mycopier! you can easily toggle the ED option on and thus
up+download such ATR images without any problems. At least it worked
fine for me...

Hmmm, MyDOS does not read the second VTOC of a DOS 2.5 ED disk, when
showing the directory and/or free sectors. But as said before, when
copying files (with option "C" copy file/s) from a DOS 2.5 ED disk it
can access (read!) the whole disk and thus it will for sure also read
the second VTOC. At least I never had problems to read a file from a DOS
2.5 ED disk (even beyond sector 719!) and convert it to a different
MyDOS format... -Andreas.

A few lines of ASCII art in each post might be understandable. But the
number of lines that required snipping to reply was nothing less than
ridiculous.

Your excessive use of ASCII art can be considered proof positive that you are
indeed _exactly_ what you called John Burns. And that you also are stuck in
the 80's.

Well, you might want to check into copyright law again. It is now a
criminal offense in the United States and the copyright holder does
not even need to be involved for action to be taken which can result
in a fine and/or jail time last I looked.

I remember the ASCII art of the 80's also. Most BBSes had a place for it,
and later ANSI art. In the world of Commodore we also had PETSCII art.
However, it was usually frowned upon when messages containing large amounts
of art were posted in other than the designated areas. Most sysops would
either move the message to the proper area, or just delete it.

Usenet has a place for ASCII art too. alt.ascii.art is one such newsgroup,
rec.arts.ascii is another. It would be nice if Bateau would post his art
there and leave the comp.sys hierarchy alone.

Well that selfish attitude is hardly a surprise and only points to someone who thinks what he says and does is correct irrespective of the wishes or truth of the matter.

I don't know if this is stricly true personally I feel it is due to the Internet's rise and the subsequent proliferation of copyright theft which has led to much more publicity being given to the issue. Especially when involving the music /movie industry which has always been pretty pro-active in prosecuting and protecting its assets. As has been stated most copyright theft still isn't prosecuted.

1141. New Programming for ATARI -- Break the 64K Barrier!

Newsgroup: comp.sys.atari.8bit
Date: 2004-03-09 03:37:47 UTC
From: Bill McBrine <billmcbrine@shawSPAMKILLER.ca>
Message-ID: <ajcq40571old0e435opc4dj8tkdndfu3bo@4ax.com>
Source record: 16796

Hello All!

I just happily read the backdated posts about "accelerated 8bit" and ideas how to speed up the ole Atari. This is something I've spent days in the past dreaming about how to do. I have some ideas on a co-processor plan, but realistically I don't think it would be worth it. If the purpose of the project is to help "the Atari community" then hardware priced easily near or over $100 would simply not be viable for most people still using their Atari. So, as I'd love the idea of improving the Atari for all, a hardware project seems out of the question, IMHO.

Software design is the only area the community as a whole (what remains) can be potentially reached. Hence, I have also worked on a software design to provide a more usable environment. Another reason to go with software-only is it is also available to Emulator users. Not everyone who would use the A8 has a physical Atari on their desk today. And emu's also have support for "expanded" Atari's with extra memory and other hardware simulation.

Features of my language project:
o Use your upgraded memory for something other than ramdisk
o Linear memory space above the 64K limit
o Compile/Port larger programs for the Atari-8bit
o Possibility of a New OS using this technique
o Use standard 6502 Assembly
o Can also use cc65 and compile to asm source first
o The assembler handles all the memory banking itself!
o Possibility of using ALL your extended ram as one program!
o No special hardware! Any 128K Atari or above will work!
o Only problem I foresee may be the small stack space

Read on ...

Let me reference a post from Mr. Larry White.

<QUOTE>
From:********** (LarryWhite)
Newsgroups: comp.sys.atari.8bit
Date: 14 Dec 2003 00:52:07 GMT
Message-ID: <20031213195207.11235.00000731@mb-m11.aol.com>

Other progs are memory bound -- where having lots of contiguous memory
would
help -- sort of the "ultimate ram disk". (Oops -- we need languages
and an O/S

that could use the extra memory, don't we...) Still, a reliable 65816
and
memory management system would help this a lot.
</QUOTE>

"we need languages and an OS that could use the extra memory."

What I have come up with is a fairly simple design that I originally thought of back about 8 years ago - I even posted about it here, but never received any emails about it and so I basically dropped the idea. If there is any real interest, I would be willing to consider doing the project, and would welcome others to assist. It involves a "virtual linear memory space" using the banked ram of the 130XE and similar upgrades. Any amount of expanded ram would work. I have a trick in mind that may work for programs over 64K! This concept may be very useful for any restricted memory-space computer supporting some kind of bank-swapped ram.

This would probably be done as a specially modified assembler project and compile the source to this linear memory model. It would also not be specific to the type of memory banking. Meaning it would work with 130XE modes, but also different styles (not compatible with the 130XE) of memory upgrades by simply using a different "memory handler". A Very Key Point here, is this assembler would automatically handle the memory banking itself at compile time! All you do is write asm instructions, or your ANSI C code. All the code and variable references are taken care of for you within the assembler!

I also consider the viability of modding cc65 to compile directly to this mode. That would be handy, wouldn't it? :-) But I expect the assembler is more flexible, and besides, one can always compile your C source to assembly, then feed it into this assembler. One more thing. There would be a small performance hit to the computer for this to work. Depending on exact implimentation, and on program flow, it could be somewhere from only 1% to 10%+.

Another idea I have is to include reusable 'microcode' routines for more compact programs. Instead of redoing the wheel, or inlining subroutines as macros over and over, simply call the microcode routine, and only use a handful of bytes. There is lots of good 6502 code available to utilitize for this purpose I think.

It's a tricky technique my idea, and still theory. Anyone interested?

=Bill=

Sincerely, =Bill=

Please cite the legal precedent for this and I'll certainly check it out. The truth is a c&d is really only a means of saving oneself the hassle of bringing a law suit, it is not a prerequisite to doing so. As I said before try checking your facts first. Maybe I am living in the 80s but that is surely better than the fantasy land you live in where ideas become reality. BTW I studied for, and gained, my degree in Law at a University where did you get yours - mail order was it?

As for who is the dumbass let's see the proof for your statement. No proof and you'll have been hung by your own petard.

>> I suggest GIF. It's an old format, and I know there are readers
>> for the CoCo 3 and C=64/128, probably also Apple.

Most magazine articles are just text. So, I would suggest that plain text is the most appropriate way to handle it. It will download far faster, take far less storage, and can be read by the widest range of machines. When articles contain programs, it will be far easier to extract and run them if they are ASCII text, rather than some image format.

When there is a relevant illustration, then they should be provided in an appropriate image format (like GIF for schematics, or JPEG for photos, etc.)

I did some work to put Tom Pittman's early Tiny BASIC books and articles on-line for him. We put the text in HTML format, so it could be presented with approximately the same page layout as the original, yet still easy to view with a web browser or to save as ASCII text so you could run the programs. HTML made it easy to connect it to the illustrations. The hypertext links also allowed for fast jumps to the index, table of contents, etc. It worked out rather well.

On copyrights: A lot depends on the situation. I've written many articles, and generally don't mind if someone reprints them. It's polite if they ask first; when they do I almost always give permission. When I find one that's been posted without permission and without crediting me as the author, I ask them to take it off. So far, in all cases they do, or we come to some agreement.

So, I would suggest that you try to contact the author and get permission. If that fails, print it but credit him for the work. If he contacts you, do as he wishes (its his material, after all). And in any case, don't try to sell material that you know you don't own and don't have permission to distribute -- THAT is what will get you into deep trouble!

I've only had one case where someone stole my work without permission and sought to make money from it. It eventually came to lawyers, and I threatened to sue. Their lawyers advised their client that they would certainly lose, and we settled out of court for $10,000. It was an expensive lesson for them, I'm sure.

Glad you made this point Lee as many copyright cases are settled in such a way (out of court) and therefore obviously don't get any media attention. Hope you enjoyed spending the money :) Publish and be damned is an old saying but when it involves copyright material it usually ends in (the publisher) being damned poor.

You know, that's partially self-contradictionary. Standard 6502
assembly cannot provide a linear programming model for more that 64K
since it's a 16 bit processor after all. What's the route you're
planing to go? Compiler supported bankswitching would mean enhancing
the cc65 (a pure software/compiler project), a "new Os" is an assembly
project (or C, if you want to go), linear programming model is an
emulator project (I assume you're not going to build an FPGA with a
backwards compatible 6502 CPU on it. (-;)

> Other progs are memory bound -- where having lots of contiguous memory

> "we need languages and an OS that could use the extra memory."

Just let me play devil's advocate for a moment: For which purpose?
For a programming environment, the last twenty years really didn't
leave the software market unaltered. Just "to have an Os" is not quite
an answer. Who would be using it for which purpose? There's nearly no

new software written for the 8 bits. What's running is running, and the main (or probably "my main") interest is in the old games I'd like to play. If you need *more* to be done, hey, there's my PC and there's my Amiga (at least once I would get it repaired).

Sorry, didn't want to stop your enthusiasm. If it's a fun project for you, please go ahead. Just want to say that there might be less applications than you'd probably consider, so please don't feel disappointed later.

So long,
Thomas

These can't be serious offers. I've seen some crazy "collector
behavior" on eBay, but these games aren't even worth one hundredth of
what they're listed at! And the "Buy It Now!" prices are really
astronomical.

I'll say I'm pretty skeptical. Yout code generator will have to verify every code reference to make sure that the target resides in the same memory bank. In the case of interbank subroutines, you will have to have some sort of entry/exit code that resides outside of the banked area to handle the bank switching. That's a lot of overhead right there.

While it's entirely probable that such a compiler could be constructed, it would be similar to a wheel built out of bricks. Who would choose to use it ?

I hate to nitpick, but one cannot be hung by ones own petard. The petard was
a small gunpowder bomb in use in shakespearean times, and "to be hoist by
one's own petard" means "to be blown up by ones own bomb". It has nothing to
do with hanging, that is a common but incorrect inference of the meaning of
the phrase.

The buyer looks like a fake. Can't guess what the motivation is since
you have to pay eBay for auction.

1159. Monkey Wrench II - Emulator Question

Newsgroup: comp.sys.atari.8bit

From: bschwabe@atlanta.nsc.com
Message-ID: <404e23a6.17092920@usenet.nsc.com>
Source record: 16666

Hello,

I own a "Monkey Wrench II" right cartridge that I have created
a ROM image of by dismantling the cartridge and placing each
ROM (x2 HN462532G) in a CP-1128 (PLD/EPROM Programmer). By
concatenating the two extracted ROM images into one I now have
a single 8K ROM image but I can not seem to configure the ATARI800
or the Atari800Win emulator programs to recognize the cartridge under
the "F1" option and specifying the right cartridge. Does anyone have
ideas as to what may be going wrong here?

Thanks

The emphasis I wanted to place...was that breaking copyright
laws is becoming simpler every day. With the internet, CD burners,
DVD burners, computers, digital cameras, et al, ISTM that holding
the line on "copyright theft" is getting very difficult.

Actually, the company I worked for got it. I simplified the story to keep it succinct. I was the tech writer that wrote the manual for a microcomputer board based on the RCA 1802. A competitor copied this manual, deleting our trademark and name and substituting their own. My company threatened to sue, the other company backed down and settled out of court for the $10,000.

> Publish and be damned is an old saying but when it involves copyright
> material it usually ends in (the publisher) being damned poor.

It's become a very complicated situation. The original intent of the copyright laws has largely been defeated. We now have descendents of Mark Twain recopyrighting his works, people with copyrights to the "Happy Birthday" song and charging royalties, classic movies like "Casablanca" colorized to make it a 'new work' and re-copyrighted, companies like Microsoft keeping their old copyrights in force so they can *prevent* their distribution to compete with current products, etc. With enough money and lawyers, copyright are effectively immortal.

Sorry missed this originally

US law isn't my thing (I'm in UK) but I've always understood it was the same in this respect. Are you by any chance referring to other laws (soon to be enacted in UK also) which allow criminal proceeding against those who download - if so then these are not copyright laws. The proposals for the UK will mean that those caught with illegal downloads (mp3s etc.) can have their bank accounts frozen and assets siezed (house and contents etc.) - again related to copyright theft but not a copyright law in itself. Either way it's pretty harsh if you get caught.

[snip]

Quite understand and there is also the mentality which says since nothing physically is taken from you then nothing is actually stolen.

Fair enough but that doesn't mean the law itself is wrong just those who abuse
it for their own intent (holder or pirate). Copyright Law by and large still
retains its original intent to protect the IP of the originator.

Private piracy may be easier now, maybe even harder to catch and harder to stop.

But if somebody goes out and tries to make money or broadcast or reuse the materials (as on a website, etc) .. or simply brags too much for their own good at the wrong time and place, there's nothing particularly hard about catching or prosecuting that.. regardless of any of the technologies mentioned above.

What usually lacks is the motivation to focus on and pursue such matters by the bulk of regular law enforcement agencies.. as opposed to pursuing druggies, rapists, thieves, killers, drunken drivers and such. Also not much interest by the press to cover law enforcement efforts. But there are units working .. and catching pirates and other computer criminals.

d.

I accept and know what Shakespeare actually said (Hamlet act 3, sc 4

(speaking of Rosencrantz and Guildenstern - his chlidhood friends)

[R and G will] marshal me to knavery; let it work
for 'tis the sport to have the engine(e)r
Hoist with (by) his own petar(d); and 't (it) shall go hard
But I will delve (dig) one yard below their mines
and blow them to the moon

(??) = modern wording / spelling

In other words Hamlet is (metaphorically) saying that he will use their own bomb (he suspects they are out to betray him) to cause their demise by planting his own below it. (He succeeds BTW: The "bomb" is actually two sealed letters (carried by R and G) from King Claudius ordering Hamlet's death. His own "bomb" is that he opens said and simply changes his name to those of R and G respectively - nice friends huh?).

In the context in which I used the phrase (metaphorically also) I meant that his argument would be hung (as in "hung out to dry" (exposed)) by the very device which he attempts to use to blow up my argument. His reply that I should do my own research only shows how weak his argument was. I cannot prove a negative, but then neither can he (hence his feeble reply); it is for him to show proof.

Of course I accept that my use of the phrase was open to mis-interpretation since most see it as a physical (hung (hanging) and petard (some sort of crane))

statement than as metaphor, mea Culpa. But then when it leads to a discussion on Shakespeare can it be so bad ;)

Yeah spindizzy was the bomb. I have a boxed one I will never let go
of. It spawned a lot of sequels on Super Nintendo and Atari ST.
Airball and Spindizzy are the 2 best 3D isometric games on the 8-bit
in my opinion, both about equal quality, both different in gameplay.
Spindizzy you worry about falling off of stuff a lot more than in
Airball making it higher stress, but a good challenge. Spindizzy makes
me wish they would have tried to do a "Marble Madness" but oh well.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

> Hello All!
[snip post about assembler]

In the 99/4A world, we have the AMS memory card allowing up to 1 mb
(!) of memory. This memory is paged over the standard 32k in 4k
blocks.
The C compiler we have for it (c99) doesn't directly take advantage
of it, neither does the new assembler for the card. The c99 compiler
was only rewritten to use branch and load workspace pointer (BLWP)
instructions vs branch and link (BL) because the use of extra memory
requires "stubs" for changing the bank switching, and they only work
with BLWP's, not BL's.

What allows this? The Linker itself. You can make a control file
(similar to a make file) with the layout of your routines, in a Tree,
with co-dependent routines on the same level. With this scheme, the
Linker handles placement of the routines and inserts small code
sections ("stubs") to handle the bankswitching.

So, have you thought of using this approach?

Ben

Ain't no such thing as "copyright theft", except in the eyes of Jack
Valenti and the judge who wrote the now-overturned Verizon ruling
(who just dictated Jack's argument). The real animal is called
copyright infringement.

Hi,

I recently saw one go for like $9 on ebay. I think there is one
included in a big "lot" of 8bit stuff for $99 at the moment. Yes,
they are very useful! In order to test it, you will need "special"
cables, that you can make, if you are handy with a soldering iron, and
have the manuals. If not, I think I saw some info on the web, but
did not bookmark it. I currently just use port 1, that supports all
of the "modem" lines, and I'm not sure if I could test ports 2-4, or
even the parallel port however.

1182. 825 printer ribbons

The previous post was supposed to be sent a couple weeks
ago! I must have selected the "send later" button, so
forget what I said about that $99 lot, as that is long gone.

There is one 850 on ebay for $10, ans I almost bought one for
$3 the other day, but the seller did not return my mail
regarding shipping costs in time. I was hoping to grab it
in case my 850 ever dies.

They seem to be $7.95 at http://www.myatari.com/bc800hw.txt

I'm not affiliated, but bought some stuff about 10 years ago
from them!

On a humorouse note, I threaded an old typewriter ribbon onto
the spools of my 1025, and it prints characters in half red/black.
One of these days I need to get a real ribbon.

I only speak (Turbo)BASIC myself. So now that I know it should be possible
to detect separate ANTIC access without human interaction, I only have to
find somebody who is willing and able to code a utility for me that will do
just that. If that programmer would be willing to release his/her source
code to that program/routine, that would be even better. This because that
would mean everybody could integrade that routine into his or her software.
Maybe a job for you?

If we can test for separate ANTIC access, software can be written in such a way, that it can adjust itself to whatever the testresult is. Just like some software tests if highspeed IO (to a disk drive) or the use of a RAMdisk is possible.

> for the ramdisk / the rambanks, then separate Antic access is not
> possible).....

Please reread my previous message on this subject. I explained that there are several possibilities to use the ANTIC bit/pin in RAMupdates. The 130XE (with it's standard 128kB total RAM), my upgrade use the ANTIC bit/pin as intended. Some upgrades also use this bit/pin to select RAM (meaning you have ANTIC access with one half of the available extended memory and no ANTIC access with the rest). Some upgrades tie ANTIC access (to extended RAM) to the CPU bit/pin. Others just disable ANTIC access to extend RAM. I'm looking for a routine to test all of this.

> ... and 2) some chips inside your XL/XE computer (the Gate Array
> Chip and the Freddie Chip - only the 130XE has the Gate Array chip, only
> a few XL`s do have the Freddie chip)... Thus it will not be possible to
> upgrade all (already RAM upgraded) XL computers for separate Antic
> access and so this special mode looks a little useless to me - if we
> want XL/XE compatibility... -Andreas.

First of all FORGET FREDDY. It just replaces some chips that were used in the XL series, like the 74LS158 (or 74LS258), the delay line, etcetera.

You can replace the gate array (CO25953) with all kinds of chips. The easiest way is using a GAL and a 74LS95(B) (check out my site if it still exists. The stuff page.). But it can be done otherwise too. But you'll need more chips.

Even if it is possible to convert every RAMupgrade so that it will have separate ANTIC and CPU access, not everybody will want to or be able to do so. That's why it is good to have a routine that can test if separate ANTIC access is available. Heck, nowadays demo's test which RAMbanks are used and

configure themselves accordingly, why wouldn't a demo (or any other
software) be able to do the same for separate or combine (with CPU) or no
ANTIC access????

> Does anyone know if ribbons are available for the Atar 825 printer?
Thanks. <

You might also wade through the suppliers of ribbons from a Google or Yahoo! search. There are several suppliers of re-inkable ribbons. While most any cloth ribbon can be re-inked with a re-inker, some ribbons are have a built-in reservoir to continually ink the ribbon. Here is one such product: http://duraprint.com/reinprinribp.html

The 825 was actually a re-branded Centronics 737 printer. And FWIW, newer, more feature-laden dot matrix printers go on eBay for *very* reasonable prices.

Yeah it always makes me laugh that those who oppose the anti-warez posting
policy on c.s.a.games think they are oh so clever when posting links to warez
sites. Invariably the site is closed down shortly thereafter - shows their
mentality.

No probs, I didn't think you were and I've been known to be a pedant on similar
hence no complaint from me. I just get rather peeved at those who try to spread
their non-knowledge as fact - there's enough mis-information on the net already.
And of course when this "fact" could land others in legal hot water it is even
worse.

> > discussion on
> > Shakespeare can it be so bad ;)

Yeah, but one of the problems with him is that so many of the words and phrases
have changed meaning over the years that for the uninitiated it is easy to
mistake the true meaning - especially when used or read out of context.

Fair point but this isn't a court and I think we all understand what is meant by the term. Let's be honest there are many words such as warez and piracy used in such discussions which don't have any real legitimacy but it's far easier and quicker to use such common descriptors than the true legal definitions.

Yep, though there are those arguing against its implementation. Obviously though how much the provisos were applied would depend on how much you had been downloading without permission - but I'd imagine that for certain your computer eqpt would go.

I don't think I implied that the Law was perfect but that doesn't mean it is wrong only that it could be improved. As for your analogy with computer code that is flawed since the computer is forced to execute the code, people of course decide for themselves whether to obey the code of law. And do bear in mind that if laws were updated as often as computer code then the legal system would doubtless collapse due to no-one being able to keep up with all the changes.

Sorry,but your information is wrong. The Atari 825 printer is a modified Okidata 80 ML. Any ribbon for an Okidata ML 80,82,or 84 will work.

Typewriter ribbons will clog the printhead and,possibly burn it out.

I have 5 Atari 825 printers and know from where I speak.

A fast and dirty solution is to spray your old ribbon with WD-40 and let it sit overnight.

Atari Forever

Unfortunately I do not know anything about the workings of the TI99
computer, so I really don't know how those intructions relate to
memory use at all.

>What allows this? The Linker itself. You can make a control file
>(similar to a make file) with the layout of your routines, in a Tree,

>So, have you thought of using this approach?

* PROGRAM STUBS??

Not so far from the truth of my design. You are correct, my idea uses
'program stubs' to impliment the bank switching and other support
code. It is not however part of the linking process, nor does it
require the programmer to manually lay-out what code goes in what
memory bank. Although this may have a benefit of the programmer
knowing what code needs to be next to each other for better speed.

There would be a special loader, to load up the memory banks with
code, and facilitate the management of memory to some degree. Keep
in mind that my design is a "virtual memory" technique. Yet allows
code to run totally uninterpreted. As I stated, the programmer codes
away happily, and the assembler takes care of all references at
compile-time, including any 'stubs' that may be necessary. One effect
of this technique is that self-modifying code would generally be a

no-no, since the assembler takes care of any important 'references'.

* BUT 16 BITS IS STILL 16 BITS!

Yes - one is still dealing with a 16-bit address limit within the instruction set. So I understand peoples hesitation from being interested in this "black magic". I have mentioned it is a theory, and it is a 'trick' that I have thought of so I don't expect others to know about my ideas. It requires a code 'stub' in regular memory to be able to change banks to facilitate program flow. This program stub does the "magic" of continuing program execution at any memory bank in the computer. Hence the possibility of having a program larger than 64K with a 16-bit addressing limitation.

It is also necessary to use Two Memory spaces. The Normal and the Virtual. The virtual being among the banked ram only, and the normal being the usual memory access within the processor for accessing OS calls, or hardware, or such. That's why the assembler is necessary to handle any memory references. Otherwise, the programmer possibly could figure it out himself, using the technique (along with the stubs,etc) without the special assembler, but it would be a headache to sort out in the mind.

Hope this helps shed a little more light on the concept...

Sincerely, =Bill=

Hi..

Your ROM image is probably corrupted - perhaps the ROM's are wired up strangely, or you have the byte-order backwards. It was not unusual to make a simple copy-protection scheme by swapping a couple of data or address bits around. You also have to wonder, why 2 ROMs? does one appear after the other, or are they interleved in some way?

Easiest way to check is to look for strings of text in the ROM, and see that they read correctly in a hex-dump. eg the word "FRED" appearing in a hex-dump as "RFDE" may indicate a backwards byte-order, or you may see F<garbage char>R<garbage char>E<garbage char>D etc. the nature of the patterns should suggest how to put it back together again.

In a worst case scenario you may have to trace out the PCB to get a schematic, and reverse-engineer it to work out how it was all wired up and thus how to "correctly" decode the data.

Okidata 80 ML. Any ribbon for an Okidata ML 80,82,or 84 will work. <

Hmm...
If you do a Google search on "Atari 825" and also "Centronics 737", you will find a number of listings showing the relationship between these two printers. Perhaps Okidata was the manufacturing source for both? That wouldn't surprise me at all.

I am curious, so I searched on "Okidata Microline 80", but the only thing I came up with was replacement ribbons. One showed a picture which was the two-spool reversing ribbon -- I presume that's what the 825 uses? The physical outline of the 825 certainly has a characteristic shape of an Okidata.

I think the rewrite was necessary because the Linker and Stubs were
written for BLWP and then someone decided "c99 would be great using
this", then discovered that it used BL's instead.

I wish you luck with your design, that will require a lot of extra work. The SAMS assembler didn't really add anything besides something similar to structures (which no one has ever used, I believe), it just took advantage of the cards extra memory for larger tables. And forcing the programmer into the position of laying-out their code makes them design the program in a "structured programming" style, which some people used to think was a good thing! :)

The Linker added the stubs to switch banks. Not very many people have used this functionality - most programs written for the SAMS bypass all the routines and do manual bank-switching. But there was a program that came with the system, TI-Nopoly (a TI Monopoly game) that was over 70k, on a 64k addressable system. What makes it even more impressive, is that only 32k is RAM, so 70k over a 32k RAM.

Yes, sounds very familiar to the SAMS method. However, the SAMS method doesn't address DATA. What would you do if the programmer wanted a huge block of data? Will you force the programmer to allocate from a heap? Or will your assembler handle static allocations as well?

[snip]

Good luck anyway...

Ben

wonder if it could be written and patched for 130XE or Newell 256XL or others ?

the C128 uses something similiar, why not the Atari ?

I did a little work on aspects of this in 1989-1992 off and on. Not the large
idea of an assembler, but general routines to actually use for the basis of a variety of programs. I did this as part of a project to make use of the memory in my 130XE (1 mb+64k).

It had some peculiarities based on my preferences at the time but could be adapted to other situations. It worked like this: It used a RamDisk based off of a rewrite of Dos 2.5 code. The RamDisk and memory functions were designed to be accessible either directly or non-directly (so that the same functions would be available to any program expecting Dos 2.5). For instance to format the RamDisk you could give it a format command iocb, or XIO from Basic, or open a file called "D4:XFORMATDI.SK". Either way, the RamDisk would get the same message and do the job.

The program parts that apply to your project were that the "X:" handler would
allow you to reserve parts of the RamDisks sectors (each256 bytes) in groups and pass the pointers to their location. You could then Write sectors containing program code into those locations. You could then pass Execution to these programs. They would have available to them Program Stubs for doing things like: copying memory between banks or main memory; executing a subroutine in another bank; or continuing execution there; calculating address parameters such as bank/offset for a particular Sector of the RamDisk, etc.

By the way, the RamDisk expressed its sectors in Hex to limit it to 3 characters
like Dos 2.5. So it's total Sector count was $FFD (a few sectors for Stub info
and it's own code were used). When locating a program by reserving a group of sectors you could specify what offset location was desired in a bank.
This means if you had code set to run at $4D00, it would check that area in each bank to see if it was free. In reality any code was relocatable between
banks because all that would change was the bank pointers, not the addresses.

This rambling translates to the idea you put forth of a virtual memory address
where code would be translated too, then assembled and linked to provide the switching necessary Main Memory would be as precious as "Zero Page" because you could access it from any bank without any switching in between.
In summary the most difficult part would be how to set up and parcel out access to data, especially blocks that were larger than 48k.

At any rate, I wish you well. I would be interested to know how you would proceed with this idea.

I am 100% sure it is not really a PRINTING issue. It is a problem in the serial driver of APE. That is not compatible with XP. All other problems lead to the same root: that incompatible serial driver.

I hope there will be an update of it in the near future.

Me too! But in the meantime, I continue to look for work-arounds.

I'm not trying to be argumentative, but if the serial driver is incompatible,
why don't I have problems with disk or PC-Mirror transfers? And some people
say that they have no problems at all. (?)

Use of the term marks the user as a partisan for propagandist for
the MPAA, RIAA, and other copyright extremists. Not happy with
"piracy" -- a term which they, in earlier incarnations, invented to
demonize copyright infringers but which has instead become an almost
neutral word to describe infringement -- they switched to "copyright
theft". I won't use it and I will object to its use.

Well, I solved it.
Takes me back to the first program I ever typed in, from
ANALOG 18. I spent probably a month or more on it originally.
This only took a couple days because I remembered the major features.
I couldn't figure how a program could be just a bunch of DATA statements,
with Fs and As and stuff, I only knew BASIC statements, didn't know that the
BASIC program was a way to make a ML program on tape or disk.
I happened on a Palm Tungsten. A good BASIC for it costs $150.
That was the beauty of the Atari 800XL, it had BASIC built in, so you could
start learning programming concepts right away. If the Palm had something
you could program with, it would be nice.
Things were cheaper and better then. Computers were meant for personal
expression, not just be able to express what the OS could do that was
someone else's idea of what you wanted to do.

Fair enough but it is only a name and we all know what it describes. I certainly don't see it as "demonizing" but that's my opinion. At the end of the day those who copyright infringe *are* breaking the law - I certainly don't see any need to be politically correct to their practice. At the end of the day those who download mp3s games etc without paying for them are effectively stealing them (legal definitions aside). Demonize, No - but don't let's make them out to be some sort of modern day Robin Hoods or martyrs to a cause. They are thieves pure and simple. As for the RIAA et al, yes I'd agree that their methods are becoming rather extreme but if you haven't any illegally obtained stuff what have you to fear from (or care about) them? Some say the civil rights of the individual are being infringed but this conveniently forgets about the rights of the copyright holder.

As an aside in the UK it is unusual for anyone to be prosecuted for theft of a car invariably they will be convicted with "Taking a vehicle without the owner's consent" - There are good reasons why this is done but ask the car's owner and I'm sure he'd say that his car was stolen and the culprit was a thief. Is the culprit here being "demonized" or is it not just a case of calling a spade a spade.

Great quote :-)

To bring this back toward computers... Professors Lotfi Zadeh and Bart Kosko have been working for years with 'fuzzy logic' -- a way to program computers to have more human-like reasoning. Rather than strictly 0/1 true/false yes/no, fuzzy logic allows a continuous range of values between 0 and 1. Any value can be slightly true, half-true, mostly true, etc. As a consequence, a computer *can* partially execute an instruction. Sounds bizarre, but it works!

Many laws use fuzzy logic, though they don't explicitly call it that. Any time you have a penalty that is proportional to the crime, that's using fuzzy logic. A "fuzzy" copyright law would base the penalty for breaking it on how much damage was done. Making a copy for just your brother-in-law would cost far less than pirating copies for a million people. And, the cost for each violation would be proportional to the damage it did to the original copyright holder.

An interesting notion... :-)

Don't know if it applies to magazines, but in one case I've seen the copyright holder change with software.

One such Amstrad CPC magazine I know took quite a bit of time for someone to actually get the permission from Future Publishing in order to post the material. So perhaps other Future magazines (like Commodore Format) could have the same done (if it hasn't been done already), but I'd go to Future Publishing first.

Cheers,
Ross.

I currently own two of each and am glad of it. Actually keyboard
wise, the XL's is much better. Price wise for the XE, I paid about
$100 for each of them. It you can get a hold of one, I would go
for it.

> And some people
> say that they have no problems at all. (?)

To be honest, I don't believe them. Perhaps they did not use ape on win98 before. Or perhaps they do not run it on a 'normal installation of windows xp' (but perhaps in some kind of virtual machine). I installed Virtual Machine on my winxp machine, and installed windows 98 in it, then I ran ape on this VM-win98SE machine. It worked for 100% perfect. Unfortunately my computer is too slow to run VM very good, so that is not an option for me. I have read somewhere Windows XP is not polling the Com ports realtime, but in some kind of interrupt. I guess this is the problem. The driver should force the COM port in a real-time mode. Perhaps the virtual machine is doing that, and perhaps that's the reason why APE works fine in VMmachine win98.

I hope the bug will be found soon.

> They are breaking the law, but not laws against theft.

Semantics, Copyright, like larceny laws (theft, fraud, abstraction of electricity, etc.) are essentialy laws to protect property. If you take that property without payment or permission then you've stolen it. (For those who don't know abstraction of electricity is what you'll likely be charged with for using a fraudulent phone card).

Legally to prove theft involves certain specific criteria being met and it is for this reason that many other terms are used and prosecuted with - not because something wasn't stolen - but merely it is easier to ensure a conviction under other criteria. (q.v. car theft / owner's consent).

> >At the end of the day those who
> >download mp3s games etc without paying for them are effectively stealing
> >them (legal definitions aside).
>
> No, they aren't, and here's where the demonization lies. Infringement is
> not theft or "stealing".

Rather than it being others trying to "demonize" you appear to be trying to "decriminalise" that which you accept is a criminal act by asserting it is only infringement. Be honest infringement really only applies to publishing etc. something without the owner's consent. Using this term for those who obtain commercial material (music, games, etc.) illegaly is pretty much a cop out and

is really just an attempt to make it sound as if the offender hasn't really done anything bad at all. If they took a game or record from a shop you'd call it theft. Just because they obtained it digitally doesn't change the underlying event, irrespective of what it is actually called in law.

> >As for the RIAA et al, yes I'd agree that their methods are becoming
> >rather extreme but if you haven't any illegally obtained stuff what have you
> >to fear from (or care about) them?
>
> ROTFL. The tyrant's clarion call. "If you have nothing to hide, you won't
> mind if we search, will you?"

That wasn't what I said so please don't try to insinuate it was. They don't and can't just knock on your door and search , they do need to obtain a warrant (and that'd require some reasonable cause). As with the recent spate of paedophiles targetted for downloading their perverted shit; the police didn't just pick the names out of a hat, they had tracked their activities first. Granted, we'd all agree, that it is a much more serious crime but the principle is the same. So as I said, if you haven't done it why do you care about the guilty being caught or searched?

The truth of the matter is that those who download illegally invariably don't just do it once or with only one type of media. When their computers are seized and checked they usually have far more illegal software etc. that legal. Personally I don't care if you or anyone else wishes to do such, that is for you to decide for yourself. I don't condone it but neither do I condemn it. That said if you do it then just don't bleat about being called a thief or pirate.

I note you never commented on my car theft / owner's consent analogy - what's up, too hard was it - or did it make you realise just how silly your whole "it isn't theft" argument is?

> I think you have trouble with 2x sio speed... <

Yes, that's true. I can run 3X with relatively few issues, but 2X has never worked for me -- even with W98.

My regular Atari set-up is a Black Box/Floppy Board System, and the BB/CSS USP+ high speed drivers appear not totally compatible with APE. But I can disconnect the BB/FB (or run an 800-type OS which is oblivious to it) and have no disk/file problems at 1X, 2X, or 3X.

That requires me to load some type of high speed driver. The Happy Warp drivers don't work well. The APE-Warp O/S is inconsistent. But the Sparta USP drivers work flawlessly *every time* (even with MyDos).

My video card also seems to be a culprit in this drama. I use an All-In-Wonder AGP card, so that I can see my A8 display and APE concurrently. If I turn off the A8 window, APE prints better. (Not error-free, but prints many more lines before hanging.)

I haven't tried the Virtual Machine route -- I'll see if I cant'find some info on it.

Yes, I sure wish that APE ran as well under XP as it did with W98!

Larry

1242. Most complete ftp server with Atari software

Newsgroup: comp.sys.atari.8bit

Why are you still using such unhandy thing as Hyper Terminal? Recently
I've found an interesting program - Flash Terminal. It is really Hyper
Terminal killer. With Flash Terminal you can chat and exchange files
via modem (including v.90, ISDN, ADSL, GPRS) and null-modem
simultaneously without Internet! You can exchange up to 255 files at
once with unlimited transfer resuming after connection break. Program
includes large amount of nice avatars.
Direct link for downloading:

Does anyone have a good, reliable way to back up a cassette to disk?
I have acquired a Transdisk IV, Multi-tape to Disk Utility by Page 6
Software. In trying to use it, I'm able to create the disk to
transfer the cassette data to, but get an immediate "bad load" error
no matter what cassette I try. I also have Casdup 2 by Vervan which
seems to accept the cassette data, writes it to disk, but when I load
the disk, the game doesn't play.
I would appreciate any help or info.
Thanks,
Harvey

I dug out the old 400 and am trying to play this game but have lost the docs (as well as a good portion of my memory).

Can somebody add to or correct any of this? This is what I think I know so far:

"M" for map
"P" for periscope
"S" for sonar
1-9 for speed

On the left you have T,F,C,S which I assume is torpedoes, fuel, charge, and speed?

On the right, is C,I,H,E which I assume is a damage report because the numbers crank up as I get depth-charged. Is it (E)ngine, (H)ull, (I)nstruments and ???

What about strategy or other things to know? I thought I remember that the can recharge your batteries if you surface, etc.

Thanks for any help.

I'm getting ready to junk this stuff. If any body wants it and will pick it up in Central New Jersey, you can have it. I will not ship it anywhere.

Included are an Atari 800, Atari 1050 floppy drive, Atari 810 ??, Atari 850 Serial Interface , Atari 410 tape drive, three power supplies and about 10 manuals.

It has been sitting in a box in my basement crawlspace since about 1988. There is absolutely no guarantee that any of this stuff works.

This stuff goes in the trash on April 5, 2004

Good grief, somebody must be crazy. It's a nice 400 but $355?!

I sold an Atari 400 on eBay once for $35. It was totally functional and in okay cosmetic condition. I shipped the thing to Canada via the post office, and the buyer did not get it for 80 days or so! He never did email me to complain but then he wrote months later "I just got your item."

A400s are nice though. Great game machines.

1257. Atari 835 Modem

Newsgroup: comp.sys.atari.8bit
Date: 2004-03-15 04:35:17 UTC
From: Greg Goodwin <drclu@swbell.net>
Message-ID: <BC7A8EA2.515D%drclu@swbell.net>
Source record: 16464

Hi there... Has anyone tried to modify a 835 modem (or any of the other I/O based Atari modems)?

I was thinking of taking a newer modem and recasing it in a 835 case, reusing the lights and power switch, mainly having it look mostly the same on the outside, with the exception of the I/O ports which is where the serial port for the 19.2k-56K modem would be.

I'm a big fan of the biege 8-bits, thinking of getting the biege equivalent or recasing items to match. :)

But electronically, has anyone tried to boost the speed on the 835 modem from 300 buad to... Whatever?

Talk soon,

Doctor Clu

Wow... So THAT's what one of those boxes looks like. Amazing. Never saw
one before. My interface in roughly 1985-ish was in a usual brown box with
foam packaging. That is how they came when you bought them from Sears. I
have another one still in similar packing at the moment.

And the vintage cables... Wow... Hacked many cables but never had the
Atari standard.

Oh well! Nice to see.

Looking to make a good biege setup for the Atari 800. All biege stuff.

Not in any hurry, but if you have some biege items, I would be willing to trade. To matter the fact, I have a good assortment of Atari XL/XE, Atari ST/TT, Atari Jaguar, Amiga, and Macintosh items that I would be willing to trade. Mainly looking to trade.

Things I'm looking for:

Unique biege items. If nothing else, write me and brag about the cool biege item you have. Make for good conversation if nothing else.

Memory upgrade board for the Atari 800 of over 48K.

A Dead 810 drive. Looking to recase a more reliable Atari drive.

The Franklin 80 column card... Those are interesting. If not trading but have experience with them, tell me about them. :)

Supersalt cartridge for the Atari 800. I have the module, need the cartridge. Of course, experiences on how to get it working would also be nice.

I've been all through the Atari realm, like many here. Tried all the game systems, and I think I have settled on what I like most... The Atari Jaguar, and the Atari 800. :)

And there we go. Look forward to hearing from some of you other 800 enthusiasts out there.

And as for all you XL/XE users, I'm routing for you... We're all in this together. :D

Hi Greg!

> 1) Was a Macintosh (or Amiga) ATASCII client ever made? (Much like the
> ATS)

I don't know. I'm not an Apple or Amiga man. I owned an Apple //c twice ... very nice, but I have sold them twice too :-)

> 2) Lantronix, explain how that works please. I take it is some kind of
lan
> adaptor for more simpler interfaces?

Yes and no. It is an RS232 lan interface. It can do very much things... I did not explore all the things yet. The way I use it, is simple: as a 'modem'. As soon somebody connects to my IP number on port 8888, the lantronix sends a RING (just like a modem) to the BBS. The bbs wakes-up and communicates with the lantronix. It has a build-in intelligent telnet protocol. Very convenient, that's why you can up - and download (with the right client on your side ofcourse).

The lantronix can be used the other way to. When I type: atdt<IP-number> or atdt<host-name> I can use the lantronix to connect telnet devices. You can use this thing for much more kind of connections, but since I'm not really interested in those other options, I can not tell you much about it.

I have two version of this device:

UDS10
MSS100

Both work great. The UDS10 has a normal 'female' rs-232 on it. The MSS100 has a 'male' rs232 and needs a null-modem cable to operate. Do not know why they put a male rs232 on it... seems to be unhandy, but it certain would have a reason I guess.

Greetz,
Marius

p.s. look at www.lantronix.com for more info.

Hi,

> I'm looking for the source of the Atari XL/XE OS. Does anyone have it? Or
> disassembled it?

Not the original (copyright!), but here's a rewrite:

http://www.math.tu-berlin.de/~thor/atari++/

Check for "ROM Sources" on this page.

Greetings,
Thomas

Well, I don't have that much experience with different BASICs, but I have used Commodore, Atari and PC BASIC (Quick BASIC). From what I can recall, I found that Commodore or Quick BASIC to be the best! Atari BASIC had some strange twists and was harder to convert to. I did that on a few programs and it took some work to convert them to the Atari! I think it was easier to convert between the PC and Commodore... but if you had to convert to Atari, it was much harder because mainly how variables were handled... especially string variables!

Ah, BASIC!!! Those were the days! :-)

Well, depends on whether this person is a programmer! If they are... then this might be very valuable to them!!

Also, if you have socketed motherboards on your Atari's, then you can use this to burn replacement chips (if you have or can get eproms to burn too!)... provided you saved a copy of them somewhere! This will allow you to replace 'hard-to-find' chips and don't want to pay the prices for replacing them.

If it's just going to sit around collecting dust, then I can't see paying that much for it! But, if you are going to program or make replacement chips, then this certainly is worth it! Eprom and Eprom burners are harder to come by nowadays!

> even getting a bid?

If someone even bids on those... they need to have their heads examined too!

I saw only 1 out of the 3 that might really be worth something and that is the Omega Race with Booster Grip for the Atari 2600. It's in the package with the Booster Grip and so that one may be worth more! The other 2 is debatable? I think they are both extremely rare, but out of those 2, I would have to say that MotoRodeo is the rarest and might bring in more than Gravitar.

They even re-posted the MotoRodeo one and lowered the opening bid to $ 899 and the Buy Now to
$ 1899! Still TOO MUCH!!! Even a collector in his/her right mind won't pay that much for it! At least, I hope not!! :-)

> Not only that, I noticed that most of his feedbacks are private. Makes you
> kinda wonder doesn't it?
> Mo

Where does it say they are private? I did not see anything that said they were private.

I don't think they have private feedback on e-Bay... unless it's associated with a private auction!

I did not see any indication that there any private feedbacks on this person. ALL the feedbacks were there! Only the item descriptions were no longer available because they were more than a year or 2 old... from 2003 and 2002. I don't know how far back they go (looks like 6 months?) but they eventually disappear and so you can't go to that item anymore but the feedback still remains. Other than that, you can still read the feedback of this person and see his scores. I did not see anything private about this person! :-)

I think a seller can choose to be private or can set up a private auction... but I don't think buyers can choose to be private?

> I missing something? It's driving me crazy!

There is ALOT of stuff in that package deal!! It's hard to really set a price on it as you don't know what is really in the package or how much it's really worth!

There are many factors that go into determining what is a reasonable price for a package deal such as this.
Are they originals? Are they in mint condition? Are they rare?

In this instance, I would say that $ 200 is well within reason! I might even go as high as $ 300... but that's me! :-) It all depends on what's in the package and how valuable it is to you and whether it's really worth it or not! You can't really set prices on package deals... it depends on what comes in the package! :-)

Source record: 16481

The key is that this is NOT just a computer but rather a package deal!

Package deals usually go for much higher bids because they include other peripherals (drives, joysticks, etc) that goes with a computer and usually some or a bunch of games and software too! This one seems to fit the bill here! There seems to be ALOT of software in this deal and looks like even some rare or extremely rare ones too... some I never seen or heard of before!

Again, it's hard to really know what is a good deal or not on a package deal and it really is based on how much is in the package and the rarity of the items in the package! Average package deals can probably run in the range of $ 100 - $ 500... again, depending on what's in it and what it's worth!

But if it was just a computer, I would not pay or expect more than $ 50 - $ 100 for it... unless it's an upgraded computer (with memory or OS mods, or Pokey mods, etc). 'Mod'ed machines can bring in a much higher price... depending on the mod(s) on them, they can probably run in the range of $ 200 -
$ 500 alone!

Don't forget Stella! ;-)

I don't know if Stella was a secretary or not... but I have read somewhere that most or all the projects at Atari were named after female employees of Atari.

I will have to see if I can find that info or dig up info on code names and post it here. I think I will assemble my own article on the code names of Atari! :-)

The MotoRodeo is more than likely PAL and if so worth little or nothing,
no more that $20. If it is NTSC, very unlikely, it would be worth $150
to $200.

The Omega Race with booster grip is probably worth around $100.

The Gravitar is the Silver label version, a loose cart probably goes for
$100 so the boxed cart is worth a couple hundred.

Message-ID: <pLw5c.63090$Up2.47917@pd7tw1no>
Source record: 16493

I remember having a lot of problems doing this. Some cassettes were copy protected by attempting to start a disk drive. If the program found the drive the program would just quit. Converting a cassette to a disk file involved relocating the program in memory to allow for the dos software. Converting a boot cassette to a boot disk was not to involved and there were several utilities to do this, I think I used one from Analog magazine (or maybe it was Antic? - it was a long time ago.) Converting a basic program was easy, but involved some rewriting of the program. Each program was different - what are you trying to convert?

UPDATES SINCE PREVIOUS POSTING
2004.02.23 11.2 AtariTel and Mitsubishi Luma Video Phone history added
2004.02.19 1.3 800 memory cards story, from Jason Harmon
2004.02.08 3.4 810/1050 Duplicator bits updated, thanks Karl Heller
2004.02.04 3.4 1050 upgrades updated, http://www2.asw.cz/~kubecj/asp1050.htm
2004.02.04 8.3.f) F.Dingler game title fixes, thanks Florian Dingler
2004.01.31 new section 3.7, floppy disk preservation. old 3.7 renum to 3.8
Thanks Lee Hart.
2004.01.30 11.2 Atari corporate blurbs updated
2004.01.25 6.5 Indus/1050 power supply swapping no-no's from Paul Alhart
2004.01.25 8.4 Thomas Richter contribution, plus other updates
2004.01.15 10.2 Carina II BBS info updated
2004.01.04 8.1 X-Assembler updates

Subject: 0.1) Table of contents

0.1) Table of contents

The Computers
1.1) What is an Atari 8-bit computer?
1.2) What is the Atari 400?
1.3) What is the Atari 800?
1.4) What is the Atari 1200XL?
1.5) What is the Atari 600XL?
1.6) What is the Atari 800XL?
1.7) What is the Atari 65XE?
1.8) What is the Atari 130XE?
1.9) What is the Atari 800XE?
1.10) What is the Atari XE Game System?
1.11) What are the 6502, ANTIC, CTIA/GTIA, POKEY, and FREDDIE chips?
1.12) What is the internal layout of the 8-bit Atari?

1.13) What issues surround NTSC vs PAL versions of the 8-bit Atari?
1.14) What are the pinouts for the various ports on the Atari?

Video Display
2.1) What video display devices can I use with my Atari?

Mass Storage
3.1) What are the Atari 410, 1010, XC11, and XC12 Program Recorders?
3.2) What other cassette recorders can I use with my Atari?
3.3) How do I run a program from cassette?
3.4) What are the Atari 810, 815, 1050, and XF551 Disk Drives?
3.5) What other floppy disk drives can I use with my Atari?
3.6) What kinds of 5.25" floppy disks can I use with my Atari drives?
3.7) What can I do to extend the life of my floppy disks?
3.8) How can I use a hard drive with my 8-bit Atari?

Printers
4.1) What are the Atari 820, 822, and 825 Printers?
4.2) What are the Atari 1020, 1025, 1027, and 1029 Printers?
4.3) What are the Atari XMM801 and XDM121 Printers?
4.4) What other printers can I use with my Atari?

MODEMs
5.1) What are the Atari 830, 835, 1030, XM301, and SX212 Modems?
5.2) What other modems can I use with my Atari?

More hardware
6.1) What is the Atari 850 Interface Module?
6.2) What is the Atari XEP80 Interface Module?
6.3) What accessories did Atari produce for their 8-bit computers?
6.4) What "vaporware" computers/peripherals were never released?
6.5) What are the power requirements for my Atari components?
6.6) What graphic tablets were produced for the Atari?
6.7) What lightpens were produced for the Atari?
6.8) What lightguns were produced for the Atari?
6.9) What paddles were produced for the Atari?
6.10) What voice/sound synthesis hardware was produced for the Atari?
6.11) What sound-digitizers/samplers were produced for the Atari?
6.12) What sound-enhancement upgrades were produced for the Atari?
6.13) What MIDI enhancements are there for the Atari?
6.14) What graphics enhancements are there for the Atari?
6.15) What types of memory upgrades are there for the Atari?
6.16) What networking hardware is there for the Atari?
6.17) Can I attach an ISA card to the Atari?
6.18) What preventative maintenance can I do on my Atari system?

Core software: OS, BASIC, DOS, Modem handlers
7.1) What versions of the Atari Operating System (OS) are there?
7.2) What is the ATASCII character set?
7.3) What is Atari BASIC?
7.4) What are Atari DOS 1, DOS 2.0S, DOS 3, DOS 2.5, and DOS XE?
7.5) What are MyDOS, SpartaDOS, and other popular DOS versions?

7.6) How do I modify Atari DOS to support more than two drives?
7.7) Are there Graphical User Interfaces (GUIs) for the Atari?
7.8) What should I know about modem device handlers?

Software
8.1) What programming languages are available for the Atari?
8.2) What cartridges were released for the Right Slot of the 800?
8.3) What games support 4 or more simultaneous players?
8.4) What programs run only on the 400 and 800 models, and why?
8.5) What programs make use of the Light Gun or a light pen?
8.6) What programs have a track ball mode or support a mouse?
8.7) What programs have a paddle(s) or Koala Pad mode?
8.8) What programs have a CX85 Numerical Keypad mode?
8.9) What programs have a Touch tablet mode?
8.10) What kinds of RAMdisks can be set up on the Atari?
8.11) What programs support a RAMdisk?
8.12) What programs require a RAMdisk?
8.13) What voice/sound synthesis software is there for the Atari?
8.14) What programs support stereo and upgraded sound?
8.15) What games support online action via modem?
8.16) What programs support Atari computer networking?

Working with Atari files: Compression, File formats, Copying
9.1) How can I work with .arc files on my 8-bit Atari?
9.2) What file formats for entire disks/tapes/cartridges are there?
9.3) How can I copy my copy-protected Atari software?

Interoperating with "modern" computers
10.1) What programs can log in to other computers via modem?
10.2) What programs can I use to host a BBS on the Atari?
10.3) How can I read/write Atari disks on an MS-DOS PC?
10.4) How can I read/write MS-DOS PC disks on my Atari?
10.5) How do I transfer files using a null modem cable?
10.6) How can my Atari use my PC's HD using SIO2PC or Atari810?
10.7) How can my Atari use my PC's HD, printer and modem using APE?
10.8) How can I connect my 1050 drive to my PC with the APE ProSystem?
10.9) What about interoperating with the Apple Macintosh?
10.10) Are there 8-bit Atari tools for the Commodore Amiga?

Timeline
11.1) How did Atari get its name?
11.2) What is the History of Atari?

Subject: 1.1) What is an Atari 8-bit computer?

Based in Silicon Valley in the U.S.A., the company known as Atari produced a line of home computers from 1979 to 1992 often referred to collectively as the "Atari 8-bits," the "8-bit Ataris," the "400/800/XL/XE series," etc.

The computers included the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System.

These machines competed in the marketplace most directly with the likes of the Commodore 64 series, the Apple II series, the Texas Instruments TI99/4A, and the Radio Shack Color Computer, among others. Of these, the 8-bit Atari is most similar to the Commodore 64.

In marketing their computers to the public, Atari always had to contend with their company history and reputation as a maker of video games. While the 8-bit Atari computers in their heyday were technically quite comparable if not superior in the worlds of home and business personal computing, they also live up to the name "Atari" with a huge library of video games which were often outstanding for their time.

The 8-bit Atari computers do not use the same cartridges or floppy disks as any other Atari platforms, such as the 2600 Video Computer System (VCS), the 5200 SuperSystem, the 7800 ProSystem, or the ST/TT/Falcon computers. All of these but the 5200, however, do share the same joystick/controller hardware port.

The 5200 SuperSystem is actually nearly identical to the 8-bit computers internally, yet cartridges for the 5200 and the 8-bit computers cannot be exchanged, primarly due to the physically different cartridge ports.

Here are some of the performance specifications of the 8-bit Atari computers:

(Some of the rest of this section by Bill Kendrick)

CPU: 6502 (MOS Technology)

CPU CLOCK SPEED:
NTSC machines: 1.7897725 MHz
non-NTSC machines: 1.773447 MHz

SCREEN REFRESH RATE:
59.94 times per second (Hz) on NTSC Ataris
49.86 Hz on PAL machines

GRAPHICS MODES:

ANTIC Mode #	CIO/BASIC Graphics #	Type	Display Resolution (full screen)	Number of Colors
2	0	Char	40 x 24	1 *
3	-	Char	40 x 19	1 *
4	12	++	Char 40 x 24	5
5	13	++	Char 40 x 12	5
6	1	Char	20 x 24	5
7	2	Char	20 x 12	5
8	3	Map	40 x 24	4
9	4	Map	80 x 48	2
A	5	Map	80 x 48	4
B	6	Map	160 x 96	2
C	14	++	Map 160 x 192	2
D	7	Map	160 x 96	4
E	15	++	Map 160 x 192	4
F	8	Map	320 x 192	1 *

F 9 + Map 80 x 192 1 **
F 10 + Map 80 x 192 9
F 11 + Map 80 x 192 16 ***
* 1 Hue; 2 Luminances
** 1 Hue; 16 Luminances
*** 16 Hues; 1 Luminance
+ require the GTIA chip. 1979-1981 400/800's shipped with CTIA
++ Not available via the BASIC GRAPHICS command in 400/800's.

GRAPHICS INDIRECTION (COLOR REGISTERS AND CHARACTER SETS):
Nine color registers are available. Each color register holds any of 16 luminances x 16 hues = 256 colors. (Four registers are for player-missile graphics.

Character sets of 128 8x8 characters, each with a normal and an inverse video incarnation, are totally redefinable.

PLAYER-MISSILE GRAPHICS: (byte height and OR corrections from Piotr Fusik)
Four 8-bit wide, 120 or 240 byte high single color players, and four 2-bit wide, 120 or 240 byte high single color missiles are available. A mode to combine the 4 missiles into a 5th 8-bit wide player is also available, as is a mode to OR colors or blacken out colors when players overlap (good for making three colors out of two players!) Players and missiles have adjustable priority and collision detection.

DISPLAY LIST INTERRUPTS (DLI's):
Screen modes can be mixed (by lines) down the screen using the Display List - a program which is executed by the ANTIC graphics chip every screen refresh:

All other screen attributes (color, player/missile horizontal position, screen width, player/missile/playfield priority, etc.) can be ajusted at any point down the screen via DLI's.

SCROLLING:
Fine scrolling (both vertical and horizontal) can be enabled on any line on the screen.

SOUND:
Four voices of 8-bit pitch-resolution, 4-bit volume-resolution, 8-distortion sound can be produced. 2 voices (1 and 2, and/or 3 and 4) can be combined to make 16-bit pitch-resolution. Also 4-bit volume-only modes can be enabled for digitally sampled sound replay.

A fifth "voice" is produced by the internal speaker on Atari 400/800's (for keyclick and buzzer) and in the XL's and XE's this was (fortunately!) rerouted through the normal audio output, and the keyclick can be disabled.

Subject: 1.2) What is the Atari 400?

Released along with the 800 in 1979, the 400 was the low-end model of the two. The only 8-bit Atari with a membrane keyboard rather than a full-stroke keyboard. One of the few 8-bit Ataris lacking a composite monitor port. Originally released with just 8K RAM, but most were sold with 16K RAM. Atari sold the Atari 400 48K RAM Expansion Kit, which required a little soldering, to dealers only.

Only the 400 and 800 8-bit Atari models have four controller (joystick) ports.

Early 400 units include the CTIA chip; later units include the GTIA chip, also present in all later 8-bit Ataris.

The 1982 Atari catalog calls the 400 "The Basic Computer."

The 400 was discontinued in 1983.

During development the 400 was known internally as "Candy."

Subject: 1.3) What is the Atari 800?

Released along with the 400 in 1979, the 800 was the high-end model of the two. The 800 is the only 8-bit Atari with a Right Cartridge slot, in addition to the Left Cartridge slot as present on all 8-bit Ataris. Originally released with just 8K RAM, many were sold with 16K, later on 48K was standard.

The 800 is also the only 8-bit Atari with a four-slot modular design, where the first slot holds the CX801 (CX801-P for PAL machines) 10K ROM module, and the other three slots hold combinations of CX852 8K or CX853 16K RAM modules.

Jason Harmon writes: (12 Feb 2004)
"..the early ones had plastic cases on the ROM and RAM modules, and had two thumb tabs to remove the cover to access the modules. Later model 800s had 48K standard, and to improve cooling Atari installed them without the cases but put a small plastic strip across the tops of the cards to hold them in position. These machines also lost the thumb tabs and have regular screws to secure the cover over the memory slots."

Only the 400 and 800 8-bit Atari models have four controller (joystick) ports.

Early 800 units include the CTIA chip; later units include the GTIA chip, also present in all later 8-bit Ataris.

The 800 was discontinued in 1983.

During development the 800 was known internally as "Colleen."

Subject: 1.4) What is the Atari 1200XL?

Released as a big brother to the 400/800 in 1982, the 1200XL now uses Atari's slightly customized 6502C microprocessor, and includes a full 64K RAM. The 1200XL was the first 8-bit Atari with just 2 controller ports. In addition, the 1200XL includes 4 programmable Function keys and a Help key, 4 LEDs, built-in diagnostic and graphics demonstration programs, and probably the

favorite keyboard of any 8-bit Atari computer. Clicks previously outputted through the built-in speaker are now heard from the television or monitor's speaker. The revised 16K Operating System offers many new features, including an alternate International Character Set.

The 1200XL was the biggest single step forward in development of the 8-bit Atari platform, but the corresponding software compatability problems hurt its popularity.

The 1200XL lacks separate chroma video signal, and also lacks the +5 Volts power on pin 10 of the SIO port.

There is no PAL (European) version of the 1200XL.

The 1200XL was discontinued in 1983.

Subject: 1.5) What is the Atari 600XL?

Released in 1983 as a replacement for the 400, the 600XL is the low-end version of the 800XL. The 600XL/800XL include most of the features of the 1200XL minus the Function keys and the demo program. But both the 800XL and 600XL have the Atari BASIC language built-in. In addition, these two systems offer the Parallel Bus Interface (PBI), providing fast parallel access to the heart of the computer. The 600XL has 16K RAM.

The 600XL can be expanded from 16K to 64K with the Atari 1064 Memory Module.

Rarely, some late-model 600XLs were sold with 64K RAM. These may have only appeared in Canada. The box had a round gold foil sticker reading: "64k Memory -- Now with a full 64k of memory built-in."

Normally boots with Atari BASIC (Revision B) enabled; Hold down [Option] on startup to boot without BASIC.

The North American/NTSC 600XL does not include a composite monitor port; The European/PAL 600XL includes the monitor port, but this lacks the chroma video signal.

The 600XL was discontinued in 1985.

Subject: 1.6) What is the Atari 800XL?

Released in 1983 as a replacement for the 800 and 1200XL, the 800XL is the high-end version of the 600XL. The 600XL/800XL include most of the features of the 1200XL minus the Function keys and the demo program. But both the 800XL and 600XL have the Atari BASIC language built-in. In addition, these two systems offer the Parallel Bus Interface (PBI), providing fast parallel access to the heart of the computer. The 800XL contains 64K RAM.

Normally boots with Atari BASIC (Rev. B, or late models with Rev. C) enabled; Hold down [Option] on startup to boot without BASIC.

The 800XL lacks separate chroma video signal (exeception next paragraph).

There was a late version of the 800XL in Europe, called 800XLF. The 800XLF includes a redesigned motherboard (the XE design) and contains FREDDIE for memory management and has chroma output. BASIC is Revision C.

Though Atari never disclosed sales figures, the 800XL was likely the most-sold of all 8-bit Atari computer models.

The 800XL was discontinued in 1985.

Subject: 1.7) What is the Atari 65XE?

Released in 1985 as a replacement for the 600XL, the 65XE is the low-end version of the 130XE. The 65XE is nearly identical to the 800XL in features, minus the PBI. Many European (PAL) 65XE's include the ECI port, but no North American (NTSC) 65XE's include the ECI port. All XE computers also include the FREDDIE memory management chip.

Normally boots with Atari BASIC (Revision C) enabled; Hold down [Option] on startup to boot without BASIC.

The 65XE was discontinued in 1992.

Subject: 1.8) What is the Atari 130XE?

Released in 1985 as a replacement for the 800XL, the 130XE is the high-end version of the 65XE. The 130XE offers 128K RAM, plus the FREDDIE memory management chip, supporting the unique (but rarely used) ability for the 6502 and the ANTIC to independently access RAM banks. In addition, the 130XE replaces the PBI port with the Enhanced Cartridge Interface (ECI), continuing the powerful feature of a fast parallel port.

Normally boots with Atari BASIC (Revision C) enabled; Hold down [Option] on startup to boot without BASIC.

The 130XE was discontinued in 1992.

Subject: 1.9) What is the Atari 800XE?

Unseen and unknown in North America, the 800XE was sold in eastern Europe. The 800XE is identical in features to the European version of the 65XE, including the ECI port. The 800XE could also be described as a 64K version of the 130XE.

Normally boots with Atari BASIC (Revision C) enabled; Hold down [Option] on startup to boot without BASIC.

Jindrich Kubec writes, "The problematic Chinese 800XEs with GTIA problems were manufactured in 1992."

The 800XE was discontinued in 1992.

Subject: 1.10) What is the Atari XE Game System?

In a change of marketing strategy, Atari introduced the new XE Game System in 1987. Despite its label, the XEGS is a true 8-bit Atari computer system. It offers the convenience of a detachable keyboard and built-in Missile Command game, while offering 64K RAM and full compatibility with the 65XE. It was packaged with the Light Gun, and the Flight Simulator II and Bug Hunt cartridges.

Keyboard connected/no cartridge:
boots to Atari BASIC
Keyboard connected/no cartridge/[Select] held down at startup:
boots to Missile Command
No keyboard connected/no cartridge:
boots to Missile Command
No keyboard connected/no cartridge/[Select] held down at startup:
boots from disk drive
No keyboard connected/no cartridge/[Select]+[Start] held down at startup:
boots from tape drive

[Option] held down at startup = BASIC on
[Option] not pressed at startup = BASIC off
(opposite from all other XL/XE machines)

Andreas Magenheimer writes:
Tip: The confused XEGS Atarian should use the XEGS manager by Mat*Rat (Mathew Ratcliff). This assumes one knows at least how to boot a disk with the XEGS...

James Bradford offers:
There is only 1 32K ROM in the XEGS, it has the OS, BASIC (Rev C) and Missile Command on it.

The XE Game System was discontinued in 1992.

Subject: 1.11) What are the 6502, ANTIC, CTIA/GTIA, POKEY, and FREDDIE chips?

Some of the following text is taken from De Re Atari (Atari#APX-90008), a book published by Atari through the Atari Program Exchange (APX) and copyright 1982 by Chris Crawford, et al. See http://www.atariarchives.org/dere/ where the full text of De Re Atari is now available online.

The internal layout of the Atari 8-bit computer is very different from other systems. It of course has a microprocessor (a 6502), RAM, ROM, and a PIA. However, it also has three special-purpose (LSI) chips known as ANTIC, GTIA, and POKEY. These chips were designed by Atari engineers primarily to take much of the burden of housekeeping off of the 6502, thereby freeing the 6502 to concentrate on computations. While they were at it, they designed a great deal of power into these chips. Each of these chips is almost as big (in terms

of silicon area) as a 6502, so the three of them together provide a tremendous amount of power. Mastering the Atari 8-bit computers is primarily a matter of mastering these three chips.

6502 Central Processing Unit (CPU)
====
While the 400/800 models contain a generic 6502B CPU (a faster version of the original 6502A microprocessor), all of the XL/XE models contain Atari's customized 6502C chip.

On the Atari, there are two microprocessors, ANTIC and the 6502. To allow them to coexist, ANTIC must shut off the 6502, a process called DMA. The 6502B supports DMA, but in Atari's implementation, it required 4 chips. The 6502C has an extra line called HALT. It is controlled by ANTIC which uses it whenever it needs the data/address bus. The HALT line is on pin 35 of the Atari 6502C and must be pulled high for the chip to work.

ANTIC
=====
ANTIC ("Alpha-Numeric Television Interface Circuit") is a microprocessor dedicated to the television display. It is a true microprocessor; it has an instruction set, a program (called the display list), and data. The display list and the display data are written into RAM by the 6502. ANTIC retrieves this information from RAM using direct memory access (DMA). It processes the higher level instructions in the display list and translates these instructions into a real-time stream of simple instructions to GTIA.

Frank Schuster writes (6/1/02):
the patent for the ANTIC processor:

U.S. Patent 4,296,476 October 20, 1981 for a "Data processing system with programmable graphics generator". Inventors listed: Steven T. Mayer; Jay G. Miner; Douglas G. Neubauer; Joseph C. Decuir

CTIA/GTIA
=========
CTIA ("Color Television Interface Adapter") / GTIA ("George's Television Interface Adapter") is a television interface chip. ANTIC directly controls most of GTIA's operations, but the 6502 can be programmed to intercede and control some or all of GTIA's functions. GTIA converts the digital commands from ANTIC (or the 6502) into the signal that goes to the television. GTIA also adds some factors of its own, such as color values, player-missile graphics, and collision detection.

Early 400/800 models included CTIA, later 400/800 models and all later 8-bit Ataris included GTIA.

In BASIC, type POKE 623,64 [RETURN] and if the screen blackens, you have the GTIA chip. If it stays blue, you have the old CTIA chip.

By the way, apparently no CTIA-equipped Ataris were shipped to Europe.

Clay Halliwell provides this tidbit:
A bit of trivia: CTIA 400/800s artifact in blue/green, GTIA 400/800s artifact in green/blue, and all XL/XEs artifact in red/blue.

Jerry Jessop explains why French Ataris produce fewer colors:
I will tell you why it only has monochrome out, because it's SECAM and a SECAM GTIA was never produced. The PAL GTIA is used in France and the Lum outputs are run into an onboard encoder to produce a "psudo" color depending on the Luminance output, composite only. This is why a SECAM VCS or 800 has nowhere near the same number of colors (16) availible as a PAL or NTSC unit (256).

The FGTIA was never completed as the market size did not warrant the expense. The largest SECAM market is not France but the Soviet Union (former) and in 80-84 sales of these items there were not possible.

Frank Schuster writes (6/1/02):
..here a summary of Atari patents covering technical parts of the GTIA / CTIA or at least the steps of development to it. I found them by following the references made in the "newest" patent 4,324,401 which at the end stands for the GTIA.

U.S. Patent 4,324,401 April 13, 1982 for a "Method and system for generating moving objects on a video display screen". Inventors listed: David R. Stubben, Lyle V. Rains. References: 4,116,444; 4,107,665

U.S. Patent 4,189,728 February 19, 1980 for an "Apparatus for generating a plurality of moving objects on a video display screen utilizing associative memory". Inventor listed: David R. Stubben. References: 4,116,444; 4,045,789

U.S. Patent 4,116,444 September 26, 1978 for a "Method for generating a plurality of moving objects on a video display screen". Inventors listed: Steven T. Mayer; Ronald E. Milner. References: 4,016,362; 3,793,483

U.S. Patent 4,107,665 August 15, 1978 for an "Apparatus for continuous variation of object size on a raster type video screen". Inventors listed: Steven T. Mayer; Ronald E. Milner

U.S. Patent 4,045,789 August 30, 1977 for a "Animated video image display system and method". Inventor listed: Stephen D. Bristow. References: 3,793,483

U.S. Patent 4,016,362 April 5, 1977 for a "Multiple image positioning control system and method". Inventors listed: Stephen D. Bristow; Steven T. Mayer. References: 3,793,483

U.S. Patent 3,793,483 February 19, 1974 for a "Video Image Control System for Amusement Device". Inventor listed: Nolan K. Bushnell

POKEY
=====
POKEY (means "POT and KEY" as in the paddles and keyboard) is a digital input/output (I/O) chip. It handles such disparate tasks as the serial I/O bus, audio generation, keyboard scan, and random number generation. It also

digitizes the resistive paddle inputs and controls maskable interrupt (IRQ) requests from peripherals.

All four of these LSI chips function simultaneously. Careful separation of their functions in the design phase has minimized conflicts between the chips. The only hardware level conflict between any two chips in the system occurs when ANTIC needs to use the address and data buses to fetch its display information. To do this, it halts the 6502 and takes control of the buses."

The USPTO granted U.S. Patent 4,314,236 to Atari on February 2, 1982 for an "Apparatus for producing a plurality of audio sound effects" - POKEY. Inventors listed: Steven T. Mayer, Ronald E. Milner

FREDDIE
=======
The 65XE/130XE/800XE/XEGS contain a small additional LSI called FREDDIE, a RAM address multiplexer. According to James Bradford, "FREDDIE is a type of memory controller. It takes the address and clock from the CPU and multiplexes it with the appropriate timings and signals to use DYNAMIC memory. FREDDIE also buffers the system clock crystal and divides it down then feeds that to GTIA. The XEGS has a FREDDIE but it doesn't have the extended RAM. Even if it did, you would still need the chip that does the REAL bank switching. It is a small 16-pin chip (Atari/Best Electronics catalog number CO25953: rev9/page 42). It gets RAS from FREDDIE, the bank select bits from PIA, A14, A15 and the 6502 halt signal to control which bank of 8 chips RAS goes to. A14 and A15 then go to FREDDIE for the address range of the extra memory bank (or normal address range with no bank switching). The ANTIC/6502 select bits in combination with the 6502 halt line, control the switching of the PIA bank number bits to A14/A15 and which bank of memory RAS goes to. Why people say FREDDIE does the bank switching is beyond me. An 800XL can look like a 130XE with that 16-pin chip installed (That's right NO FREDDIE) and an extra 8 RAM chips."

And more recently James Bradford has written:
FREDDIE is just a memory decoder and timer. It replaces several chips in the 800XL. The small chip near FREDDIE does all the bank selection. CO25953. One line from FREDDIE, Ras (or is it cas?) goes to this chip, Halt and the bank /processor select lines go into this same chip and ras (cas?) comes out. A pin for each bank. If I remember correctly, refresh also goes into this small chip. It would be quite easy to make an 800XL work just like a 130XE with this chip since Ras (Cas?) is required by ALL dynamic RAM.

======
Technical data sheets and schematics for the ANTIC, GTIA, and POKEY chips are available on Curt Vendel's web site, thanks to permission from Hasbro's Atari Interactive Division's release of this data. See the TIFF scans:
http://www.atari-history.com/articles.html
Keith Howell has converted the hi-res TIFFs into clean HTML:

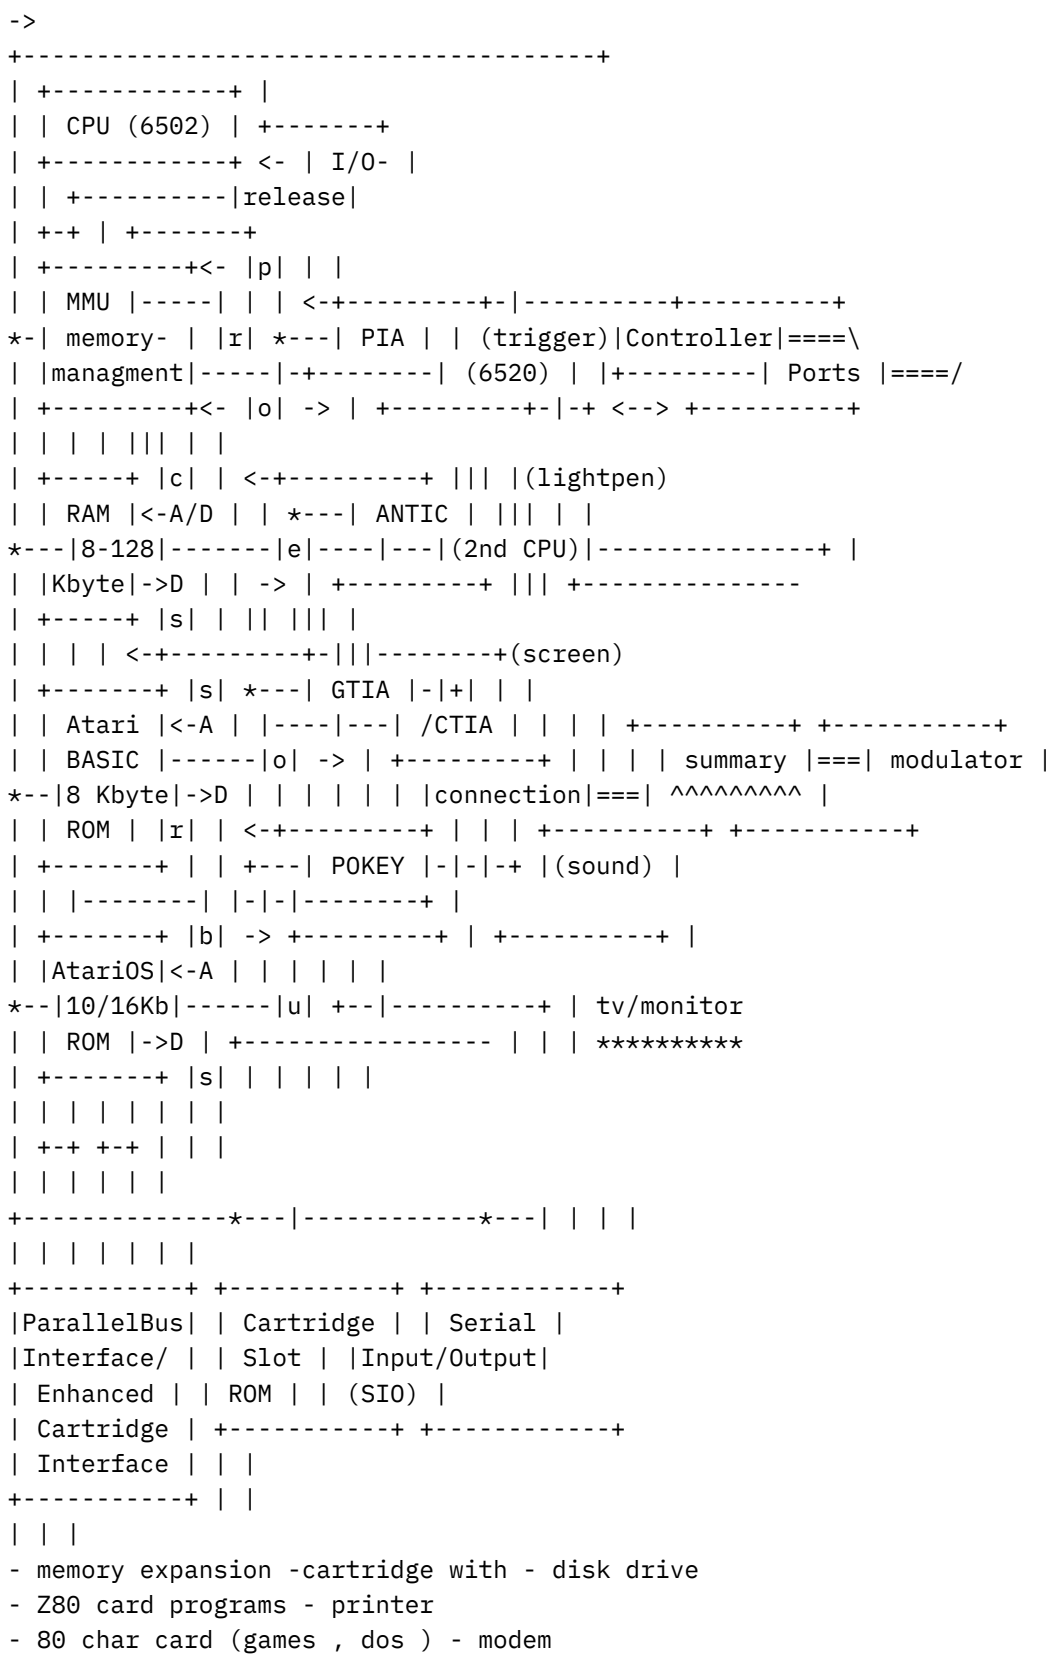
Subject: 1.12) What is the internal layout of the 8-bit Atari?

ASCII art by Thomas Havemeister.



- memory expansion -cartridge with - disk drive
- Z80 card programs - printer
- 80 char card (games , dos) - modem

NOTES
* RAM: 400/800: 8K, 16K or 48K standard
600XL:16K standard
1200XL/800XL/65XE/800XE/XEGS: 64K standard
130XE:128K standard
* ROM: 400/800:10K OS, 1200XL:16K OS, all others:16K OS + 8K Atari BASIC
* CPU: 400/800:6502B, all others:6502C
* 800 includes two Cartridge Slots, all others include one
* early release 400/800 have CTIA instead of GTIA
* 400/800 have 4 Controller Ports, all others have 2
* PBI is on 600XL/800XL only
* ECI is on 130XE/800XE/many PAL 65XE only
* Some late XE's use a 68B21 for PIA; PIA is 6520/6520A on all others

The following are most of the team who originally designed the 400/800.
Credit for providing this information for the FAQ goes to:
Doug Neubauer (by way of James Finnegan), Jerry Jessop, Scott Emmons

VLSI HARDWARE:
Jay Miner - Creator and System architect, VSLI manager
Steve Mayer - Also one of the creators - Partner in "Cyan Engineering"
Lawrence D. Emmons - Also one of the creators - Partner in "Cyan
Engineering"
Joe Decuir - ANTIC and system and creator
???A French guy - ANTIC logic designer
George McLeod - CTIA and GTIA logic design
Doug Neubauer - POKEY logic design
Mark Shieu - POKEY chip design
Steve Stone - POKEY layout design
Steve Smith - Technician for ANTIC and GTIA
Delwin Pearson - Technician for POKEY

Subject: 1.13) What issues surround NTSC vs PAL versions of the 8-bit Atari?

Contributors to this section:
Wayne Booth, Graham Thornton, Brent Buescher Jr., Thomas Richter, Jindroush

Some quick definitions first:

NTSC standard: Abbreviation for "National Television Standards Committee"
TV signal standard used in North America, Central America, a number of South
American countries, and some Asian countries, including Japan.
525 lines per frame
60 half-frames per second (interlaced) = 60 Hz
Complete frame refreshed 30 times per second

PAL: Acronym for "phase alternation by line"
TV signal standard used in the United Kingdom, much of the rest of western
Europe, several South American countries, some Middle East and Asian
countries, several African countries, Australia, New Zealand, and other
Pacific island countries.
625 lines per frame

50 half-frames per second (interlaced) = 50 Hz
Complete frame refreshed 25 times per second.

PAL-M: A modified version of PAL, used in Brazil.

SECAM: Acronym for "systeme electronique couleur avec memoire"
TV signal standard used in France, eastern European countries, the former USSR, and some African countries.
625 lines per frame
50 half-frames per second (interlaced) = 50 Hz
Complete frame refreshed 25 times per second.

Now then, how do the differences among 8-bit Atari computers designed for the different world television signal standards affect users trying to use software written elsewhere in the world?

The 50Hz vertical refresh frequency of PAL machines translates into more vertical blank interrupt (VBI) time for demos and other computation-intensive graphics software, when compared to the time available for VBIs on NTSC machines with the faster 60Hz refresh frequency. So PAL demos and games that won't work on NTSC machines are usually returning from a VBI too late. Some also attempt to use more vertical resolution ("longer" display lists) than an NTSC display can handle.

Note that the reverse is also true. Software using VBIs will run more slowly on a PAL Atari than on an NTSC Atari.

Replacing the NTSC ANTIC chip in an NTSC Atari with a PAL ANTIC changes the screen refresh rate to 50Hz, allowing most of the PAL-only European software to run on a North American NTSC Atari. However, make sure your display device can support a 50Hz PAL signal first! North American Atari users can also obtain and use real European PAL Atari machines, with the same caveat concerning the display device.

Bottom line:
Software written for NTSC machines (North America) will (almost) always work on PAL machines (Europe), but software designed on PAL machines won't necessarily work on NTSC machines.

Jindroush contributes: (2/26/02)
Could there be a program which runs on NTSC Atari and not on PAL Atari? Yes, if it uses some precise timing copy protection (probably based on vblank timing). Examples of these are Transylvania and The Quest by Penguin Software.

Thomas Richter mentions another NTSC vs PAL issue:
Another point is that the popular pseudo-colors used in the ANTIC-F (Graphics 8) mode are not colorful at all when displayed on a PAL TV, because of differences in the color encoding for the TV. The schematics of the XL computers include however a hack how to change the PAL version to the NTSC version (the PAL versions include two crystals, one with 5/4th of the frequency of the other. One is used for the system clock, the other for the color clock), but I never dared to apply it.

And on 10/16/03 Thomas Richter answered a related question this way:
>> Note that it's typically not too hard to get an NTSC Atari to run in PAL
>> by just swapping out the ANTIC chip.
>>
>> Unfortunately, some demos actually check the OS ROM for a particular
>> value to see if it's a PAL machine or not, and then refuse to run if
>> they are. *grumble* I'd rather have a warning than a refusal. :^P

> As far as I am aware, the only value to tell a PAL from a NTSC machine is in
> GTIA. Maybe swap that one as well and see what you get

Absolutey correct, GTIA keeps the PAL/NTSC register and the Os rom reads it
from there. However, besides the GTIA PAL and NTSC machines differ in other
aspects. For example, on PAL machines an additional oscillator of 5/4 of the
main frequency is present to generate the color frequencies needed to drive
GTIA. There is no such circuit in NTSC Ataris. Besides, this factor of 5/4 is
also the reason why you don't get "artifacted colors" on PAL machines (or, at
least, not very good ones.)

Subject: 1.14) What are the pinouts for the various ports on the Atari?

Controller Port (4 on 400/800, 2 on all others):

Subject: 2.1) What video display devices can I use with my Atari?

Contributors to channel output variations list:
Jon Levy, Rene de Bie, Sysop Fox-1

Most 8-bit Atari computers put out video signals in two places:

1) Radio-Frequency (RF) signal, either one VHF channel, or two VHF channels selectable by a switch on the computer. Variations depend primarily on the part of the world that the particular version of the computer was desgined for.

Most North American computers: VHF channels 2-3 switch-selectable.
channels 3-4 switch selectable also reported
European computers: VHF channels 3-4 switch-selectable,
or no switch (what channel?) both reported
UK computers: VHF channel 36, no switch,
or channels 38-39 switch selectable both reported
Australian computers: VHF channel 1 (400/800: channels 1-2 selectable)

Any further clarifications would be appreciated!

Accessories needed:
a) RF Cable. (RF=radio frequency--video and audio signals in the same line)
On the 400/800 models, the RF Cable does not detach from the computer.
The output end of the cable is an RCA male connector.

b) TV Switch Box. Includes an RCA female connector for RF signal input from the Atari, input connector(s) for your TV attenna and/or cable TV company, and 75- and/or 300-ohm VHF output connector(s) for connection to the VHF input on the television. (Radio Shack carries a suitable TV Switch Box.)

2) A proprietary 5-pin DIN Monitor Jack, which includes two video signals:
a) Composite video.
b) Y/C Video, also known as S-Video:
separate composite luminance (Y) and chrominance (C) signals.

Exceptions among the computer models:
-the 400 and North American 600XL lack the Monitor Jack.
-the XE Game System includes an RCA-style jack in place of the Monitor Jack, providing a plain composite video signal only.
-the Monitor Jack on the 600XL, 800XL(most) and 1200XL lacks the separate chrominance signal. (But it exists internally, and can be restored to the

monitor jack via hardware modification.)

The pinout for the Atari Monitor Jack is in the pinouts sections of this FAQ list.

The typical Atari Monitor Cable includes the male 5-pin DIN connector on one end, and two RCA male connectors on the other end. One of the RCA connectors will carry the monophonic sound signal, and the other will carry the composite video signal. Color composite monitors were common in the mid-80's, but these days many televisions have an RCA female composite video input connector which works fine with the Atari.

You may find an Atari Monitor Cable where the video signal carried on the second RCA connector is not the composite video signal, but the composite luminance signal. These cables are for use with monochrome composite video monitors (usually green or amber).

The ideal Atari Monitor Cable includes 3 RCA male connectors on the output end, carrying the sound signal, the composite luminance signal, and the composite chrominance signal. Only the best composite monitors include separate chrominance and luminance inputs. Commodore produced many fine monitors of this type, popular with Atari users.

Lonnie McClure provides this information on suitable Commodore monitors:
1701, 1702, 1802, CM-141, 1080, 2002, 1902, 1902A*, 1084**, 1084S**

* The 1902A used a DIN connector for chroma/luma, which makes cabling a bit more of a problem. The composite and audio connectors are standard RCA jacks, however.

** The 1084 and 1084S had more than one version. Some used the a DIN connector for chroma/luma connections, like the 1902A, while some used standard RCA jacks.

The 1902 and 1902A are very different in appearance. The original 1902 shares the same slightly rounded front case design as the 1080 and 2002, while the 1902A is has a rather square case design, and was manufactured by Magnavox (as were some of the 1084 and 1084S versions).

The separate composite chrominance and luminance signals that the Atari puts out comprise what the world has since come to call Y/C video or S-video. S-video connectors are normally Mini4. It is possible to build a cable, or purchase several adapters, that can allow you to utilize the separate Y/C signals generated by the Atari with a television (or other display device) that provides a standard S-video Mini4 input jack. This is the ultimate display option for the 8-bit Atari. Clarence Dyson has a nice page about such a project at http://www.wolfpup.net/atari/svideo.html .

Adapters also exist that will take in composite video or s-video, and output a conversion of the signal as a standard VGA video signal. These are often known as a "VGA converter" or "Scan doubler" or "Up-converter." With such a device, the 8-bit Atari can be used with a standard PC VGA monitor. One such adapter is the Cheese Video Box from AV Toolbox, http://www.avtoolbox.com. AV

Toolbox produces several other similar devices. An earlier popular adapter was the JAM!! from AIMS Lab.

SCART - an acronym for Syndicat des Constructeurs d'Appareils Radiorecepteurs et Televiseurs - is a 21-pin universal connecting cable/socket system used for audio/video components in Europe. The cables transmit RGB, composite video, S-Video, mono and stereo sound. SCART, which is also known as PERITEL, EURO AV BUS and EUROCONECTOR, is common throughout Europe, particularly in France, England, Germany, Switzerland, and Scandinavia. SCART is also very popular in the Russian Audio Video market. It is possible to interface the Atari's composite video signal, along with the audio signal, through a SCART connector, though there have been few reports of people actually doing this.

Keith Howell has a nice page on some of these topics:
http://www.howell1964.freeserve.co.uk/Atari/800XL/Atari_800XL_Video.htm

December 2003--More Than Games announced "A8 A/V BOB", an audio/video breakout box featuring phono connectors for composite video, chroma, luminance, and mono audio; it also features an s-video jack providing chroma and luminance. http://www.a8maestro.com/sites/mtgcat/mtgcat.htm

---

Subject: 3.1) What are the Atari 410, 1010, XC11, and XC12 Program Recorders?

The Atari Program Recorders provide storage and retrieval of programs and data on cassette tape. In addition to the digital track that stores computer data, a second audio track is provided to play music or voice as the program runs.

Data transmission rate: 600 bits per second.
Data storate capacity: 100,000 bytes per 60-minute cassette.
Track configuration: 4 track, 2 channel (digital data and audio track)

410 Program Recorder
- early Japan version had a carrying handle
- most versions made in Hong Kong
- 410a--Taiwan version
- built-in SIO cable - must end SIO daisy chain
- power - plugs directly into wall (most versions)
- "410P" version (rare). Karl Heller writes:
"It came in the white 410 box with an Atari yellow/orange paper slip stating which power supply to use with it."

1010 Program Recorder
- Chelco version has Stop/Eject, then Pause buttons
- Sanyo version has Pause, then Stop/Eject buttons
- two SIO ports

XC11 Program Recorder
- has a built-in SIO cable and one SIO port

XC12 Program Recorder
- built-in SIO cable - must end SIO daisy chain
- Information on the Turbo 6000 Baud Interface and the Chaos Loader:
http://www-user.tu-chemnitz.de/~sgl/atari/turb6000/turb6000.htm

---

Subject: 3.2) What other cassette recorders can I use with my Atari?

Firstly Atari themselves put out several models beyond the 410/1010/XC11/XC12,
generally only known in eastern Europe:

XCA12 Program Recorder -in same case as XC12...Poland
CA12 Program Recorder -in same case as XC12...Poland
image: http://romualdl.multimania.com/images/atari/ca12.jpg
XL12 Program Recorder -XC12 w/slight changed design.
Czech/Slovak/Poland
XC13 Program Recorder -XC12 which was "T2000 ready".
Czech/Slovak/Poland

For more information on the Turbo 2000 (T2000) and SuperTurbo modifications to
Atari program recorders, with speeds up 9600 baud, see
http://jindroush.atari.org

Unlike other microcomputer systems of the time, it was very unusual to use
anything but Atari brand program cassette recorders. One third-party product
released was the:

Compu-Mate, by General Electric (GE, G.E.)
Includes external interface module, a power cord/adapter, and SIO cable.
No second SIO port - must be at end of SIO chain.

Subject: 3.3) How do I run a program from cassette?

To run an Atari BASIC program from cassette:

1. Place the cassette in the recorder.
2. Press REWIND of FORWARD, if necessary, to bring the tape to the position
where the program is located.
3. Boot the computer to the Atari BASIC READY prompt.
4. There are several possibilities for the next step, depending on how the
program was saved, and whether you want to run the program or just load
it into RAM. Enter one of the following four commands:
a. CLOAD loads programs saved with CSAVE
b. LOAD "C:" loads programs saved with SAVE "C:"
c. ENTER "C:" loads programs saved with LIST "C:"
d. RUN "C:" loads&runs programs saved with SAVE "C:"

] Relative efficiency of the three cassette tape recording techniques:
] CSAVE/CLOAD - most efficient - fastest saves/loads - tokenized files
] SAVE "C:"/LOAD "C:" - middle efficiency - middle speed - tokenized files
] LIST "C:"/ENTER "C:" - least efficient - slowest - straight ATASCII

5. The computer will "beep" as a signal for you to press PLAY on the recorder.
6. Press the RETURN key on the computer keyboard, and the program will load
into the computer.
7. Press STOP on the recorder when loading has finished.
8. Unless you entered RUN "C:" above, now enter the command: RUN

To run an Atari BASIC or machine language program from cassette upon
startup:

1. Place the cassette in the recorder
2. Press REWIND of FORWARD, if necessary, to bring the tape to the position
where the program is located.
3. Turn on the computer while holding down the START key.
But if your computer has Atari BASIC built-in and you're running a machine
language program, hold down both the START key and the OPTION key.
4. The computer will "beep" as a signal for you to press PLAY on the recorder.
5. Let go of the START/OPTION button(s).
6. Press the RETURN key on the computer keyboard, and the program will load
into the computer.
7. Press STOP on the recorder when loading is complete and the program is
running.

Subject: 3.4) What are the Atari 810, 815, 1050, and XF551 Disk Drives?

Section includes contributions by Andreas Magenheimer, TXG.

The Atari Disk Drives provide storage and retrieval of programs
and data on 5.25" floppy disks.

==> Atari 810 --- a 5.25" floppy disk drive
The least common denominator for the Atari. One mode of operation:
1) Single-Sided, Single-Density--
FM 40 tracks x 18 sectors/track x 128 byte/sector = 90K capacity
19.2Kbps transfer rate. 288RPM.
The 810 includes a 6507 microprocessor.
Shipped with DOS 1 (very early) or DOS 2.0S
earlier MPI version- push button door opening for disk access
later Tandon version- lift door, like a garage door disk access
two SIO ports
accessories from Atari:
CX8100 Atari 810 Blank Diskettes (5 per box)
CX8111 Atari 810 Formatted Diskettes II (5 per box)
CX8202 Atari 810/815 Blank Diskettes (5/box, certified for double density)

Third-party upgrades for the 810:
810 Archiver -- copy many copy-protected programs
Happy 810 -- Happy Backup, Warp Speed 52Kbps, 18 sector buffer
810 Fast Chip by Binary 10%-40% faster
810 Turbo by Neanderthal Computer Things (NCT) -- double-density
see: http://www.qnet.com/~dons/810T.html
810 Duplicator (DT-Duplicating Technologies) -- copy disks, double-density,
"read 18 sectors in the time normally for 1"

==> Atari 815 Dual Disk Drive --- dual 5.25" floppy disk drives in one unit
Were produced (all hand-built), but are very rare. One mode of operation.
Per drive:
1) Single-Sided, Double-Density--
MFM 40 tracks x 18 sectors/track x 256 bytes/sector = 180K capacity
19.2Kbps transfer rate. 288RPM.
The 815 includes a 6507 microprocessor.
Shipped with DOS 2.0D
MPI mechanism version- push button door opening for disk access
Tandon mechanism version- lift door, like a garage door disk access
accessories from Atari:
CX8202 Atari 810/815 Blank Diskettes (5 per box, certified for double density)
Stephen Knox writes (12/28/02):
I believe the story on the 815s was Atari didn't want to release them due to
severe QA problems with the drive but they had so many preorders they had to
release something. I think they filled the preorders and then cancelled the
model - Most of them got returned due to problems.

==> Atari 1050 --- a 5.25" floppy disk drive
Same as the 810, plus Dual-Density capability. Two modes of operation:
1) Single-Sided, Single-Density, 90K, 810 compatible
2) Single-Sided, Dual-Density, otherwise known as "Enhanced Density" because
it is not true double-density--
MFM 40 tracks x 26 sectors/track x 128 bytes/sector = 128K capacity
19.2Kbps transfer rate. 288RPM
The 1050 includes a 6507 microprocessor.
Shipped with DOS 2.0S, DOS 3, or DOS 2.5
DIP switches: Black & white left: Drive 1
Black right, white left: Drive 2
Black left, white right: Drive 3
Black & white right: Drive 4
Third-party upgrades for the 1050 (all add a true SSDD 180K capability):
US Doubler (ICD) SS SD/ED/DD UltraSpeed (US) 54Kbps, sector skewing
Happy 1050 SS SD/ED/DD Warp Speed 52Kbps, 36 sector buffer,
(Happy Computers) Happy Backup. also read/write 180K 5.25" MS-DOS floppies
I.S. Plate (Innovated Software) SS SD/ED/DD Ultra/Warp (USD/Happy clone)
Hyper Drive (Chaos! Computers) SS SD/ED/DD Warp Speed 52Kbps (Happy clone)
Super Archiver (CSS) SS SD/ED/DD UltraSpeed 54Kbps (US Doubler clone)
Super Archiver II(CSS)SS SD/ED/DD UltraSpeed 54Kbps (US Doubler clone)
Cheer-Up 1050 SS SD/ED/DD Warp Speed 52Kbps (Happy clone)
Speedy 1050 SS SD/ED/DD Warp Speed 57Kbps (Happy clone), 8kb buffer,
(Compy-Shop, now ABBUC) DOS, copier, track & density displays, beep speaker
Mini-Speedy same as Speedy 1050, but without displays & speaker
Super Speedy 1050 SS SD/ED/DD Warp Speed 96,000Baud (Happy clone),192K RAM
SuperMax 1050 SS SD/ED/DD UltraSpeed 52Kbps (US Doubler clone)
Lazer 1050 SS SD/ED/DD Warp Speed and UltraSpeed 54Kbps
Engl-Turbo-1050 SS SD/ED/DD Turbo Speed approx. 70,000 Baud (uses
(german Turbo) Sector skewing that differs from USDoubler)
1050 Duplicator (Duplicating Technologies (DT))
SS SD/ED/DD "read 18 sectors in the time normally for 1"
sources(Jim Patchell)http://www.oldcrows.net/~patchell/atari/duplicator.html

Klone ???????

Rich Mier professes:
You've been plugging and unplugging the SIO cable with the 1050 power pack plugged in, right? That's a no-no. Most of the time it's Okay, but about 1 in 10, 20 times, it will blow out 'U-1'. It's a CA/LM 3086 I.C. at the right, rear of the main board. A 14 pin DIL chip. Actually it is an array of 5 transistors.

Unplug the power pack from the 1050, then unplug the SIO cable. Power can be ON on the CPU. The problem has to do with the secondary winding of the Power Pack. Remember, the problem only occurs 1 out of 10 - 20 times that you do it, not all the time.

It doesn't really matter if the 1050 Transformer has power on or off, it 'Might' happen if plugged into the 1050. It is really bad on 810's.

One thing, if the system has been turned off for, oh say, 5 - 10 minutes it won't matter. By then all the capacitors should be bled(sc?) to 0 volts.

==> Atari XF551 --- a 5.25" floppy disk drive. Four modes of operation:
1) Single-Sided, Single-Density, 90K, 810 compatible
2) Single-Sided, Enhanced-Density, 128K, 1050 compatible
3) Single-Sided, Double-Density, 180K, Percom & other 3rd parties compatible
4) Double-Sided, Double-Density--
MFM 80 tracks x 18 sectors/track x 256 bytes/sector = 360K capacity
Writes "backwards" to the second side of the disk, when compared to a two-sided "flippy" disk with SSDD 180K format on each side
High speed 38400 bps burst mode usable only with SpartaDOS X, SuperDOS 5.1, TurboDOS, DOS XE, and patched SpartaDOS 3.2.
Rotaton rate: 300RPM. Since all other Atari-specific drives run at 288RPM, this results in rare compatibility issues. Specifically, these commercial disks do not load in, and can be damaged by, the XF551:
- Flight Simulator II (subLOGIC)
- Blue Max (Synapse)
- Bank Street Writer (Broderbund). Conflicting reports about this one.
8040 cpu + external ROM or 8050 cpu with internal ROM
Shipped with DOS 2.5 or DOS XE.
DIP switches: Both dips down: Drive 1
Left down, right up: Drive 2
Left up, Right down: Drive 3
Left and Right up: Drive 4
Chinon-built XF551-cannot read/write/format backside if no timing hole
Mitsumi-built XF551--can read/write backside if to timing hole, if formatted
Third-party upgrades for the XF551:
CSS XF Single Drive Upgrade--3.5", 720K floppy drive replacement
also read 720K 3.5" MS-DOS disks
see http://www.nleaudio.com/css/products/XFsingdrup.htm
CSS XF Dual Drive Upgrade--add 3.5" drive w/o losing the 5.25" drive
also read 720K 3.5" MS-DOS disks
see http://www.nleaudio.com/css/products/XFdualdrup.htm
CSS XF551 Enhancer--overcomes sensor for index hole, create flippy disks

see http://www.nleaudio.com/css/products/XF551enh.htm
CSS XF Update--replace drive OS, adds UltraSpeed
see http://www.nleaudio.com/css/products/XFupdate.htm
Hyper-XF-OS--avaiable for 5.25" or 3.5" floppy versions; uses sector skewing
and UltraSpeed (but no track buffer!); can use disk partitions
(2 on 5.25", 4 partitions on 3.5") with mixed Densities (S/E/D)
or standard 360kbytes (5.25") / 720kbytes (3.5"); can
theoretically read/write ST/PC 720k disks (software is missing!)
OS created by Stefan Dorndorf/Germany;
XF-Speedy--replaces the 8040 CPU with a 65C02 + ROM + Memory

Subject: 3.5) What other floppy disk drives can I use with my Atari?

RCP 200 DS SD/DD dual drives, slave

Subject: 3.6) What kinds of 5.25" floppy disks can I use with my Atari drives?

Russ Gilbert writes:
If you're talking standard computer store, you can't use those 5 1/4" disks. I
mean you can't use high density disks. They must be double density to use
with the 1050. Almost all double density 5 1/4" disks have a hub ring, high
density disks don't have the hub ring.

RHamiIton5 elaborates: (5/12/01)
The Atari 8 drives do not have write heads and circuity which can handle the
type of oxide coating used on the high density floppy media; they cannot write
reliably to them. The hub ring has just become a sort of marker to distinguish
the high density from the standard double density diskettes.

Way back in your apple days of '79-'82, most disks were hubless and only the
really premium brands offered hubs to prevent slippage and out of round
problems; you could even buy little kits for adding you own hub rings.

When the home computer swell really hit around '83 and price wars began, hub
rings became common on good disks and eventually became standard down to
include most generic bargain diskettes.

The introduction of high density 5.25's required a different coercivity (=
magnetizability) to get more bits in a smaller space and suitable electronics
to do it. These disks were produced hubless; was it a differentiating label or
just unnecessary because of stronger mylar construction? Anyone?

Subject: 3.7) What can I do to extend the life of my floppy disks?

Lee Hart writes (January 2004):

Personally, I have several hundred floppy disks for my Atari 800, Kaypro
4, Heathkit H89, and IMSAI 8080 computers that are 10-20 years old. What
I can say in general:

- Most disks stored in plastic boxes or ziplock baggies survived.
- Most disks stored in cardboard boxes or just their sleeves
did NOT survive.
- Some brands lasted better than others, but I haven't collated the
information so as to make any kind of definitive statements.
- If a disk cannot be read, CLEAN THE DISK DRIVE HEAD before attempting
to read another disk! Otherwise, crap from the bad disk will remain
on the head, and will scar and destroy any SUBSEQUENT disk you put
in the drive! (the voice of painful experience).
- For lack of a better plan, for each of my surviving disks I am:
a. reformatting another blank disk
b. copying the data from an old disk onto the blank disk
Then I have a more recently-produced backup disk in case the
original disk later fails.

Subject: 3.8) How can I use a hard drive with my 8-bit Atari?

Atari never produced hard drives for the 8-bit Atari, but a variety of options
have been produced over the years. No common DOS version was written with
drives the size of hard drives in mind, and very few 8-bit Atari users have
owned hard drives for the Atari. Yet, if you're serious about it, a hard
drive can make a tremendous addition to your system!

A couple of these options are hard drives designed specifically for the 8-bit
Atari computers; the rest are interfaces designed to let you attach an
industry standard SASI, SCSI, or IDE type hard drive. Customized software
(OS, DOS) is often involved as well.

Larry White contributed to some of these descriptions.
Additional Corvus info from an eBay auction by Ben Corr, 7/03.

==> Corvus hard drive (5MB, 10MB, or 20MB)
Attaches via joystick ports 3 & 4 on the Atari 800 only.

-- Corvus Integrator Board - alows access to the Corvus Disc without the
Corvus software, so that any DOS that uses standard SIO calls will work.

-- Corvus Multiplexer - used to network up to 8 Ataris to one Corvus Drive

- Corvus Mirror card - back up the drive's contents onto video tape

==> SupraDrive Atari Hard Disk, by Supra, later K-Products. 10MB or 20MB.
includes external Hard Disk Interface
Some limitations on drive type and size and total number of drives in sys.
Attaches via PBI, or ECI with adapter.
See: http://www.atarimagazines.com/v5n6/Supradrivefor8Bit.html
Maybe still available from Bob Klaas?

==> BTL Hard Disk System
BTL 2001 Connector for 600XL/800XL PBI
BTL 2002 Connector for 130XE/800XE/65XE ECI
BTL 2004 SASI Hard Disk Adapter
See: http://www.atarimagazines.com/v5n12/BTLHardDisk.html

==> Multi I/O (MIO) interface, by ICD. Includes:
- Parallel printer interface
- Serial interface, for modem or serial printer. will handle 19.2Kbps
- 256K or 1 MB RAM, for RAMdisk or printer spooler
- SASI/SCSI interface, supports up to 8 controllers.
Limited to drives with 256-byte sectors.
Attaches via PBI, or ECI with adapter.

==> CSS Black Box interface
RS-232 Serial Modem Port (19.2Kbps) w/ hardware flow control,
Parallel Printer Port,SASI/SCSI Hard Disk Port, Operating System Enhancements,
optional 64K printer buffer. Supports drives with 512-byte sectors.
PBI/ECI device. Available: http://www.nleaudio.com/css/products/black.htm

==> SmartIDE project by Bob Woolley
Uses 256 of the normal 512 byte sectors. Point-to-point wiring project.
Articles and software at http://www.wolfpup.net/atari/atari.html

==> IDE Hard Drive Interface 1.0
By Konrad M. Kokoszkiewicz (Draco) and Jacek Zuk
PBI device. Logical sector length: 256 or 512 bytes
Availability???

==> Fine Tooned Engineering (FTe) Multi I/O II (MIO II) interface
An IDE interface. Several exist, but it was never really released

==> msc-IDE Controller
created by Steve Birmanns and Matthias Belitz
* real device for the parallel-port (PBI/ECI) of the Atari XL/XE
* up to 240 partitions per harddisk supported
* emulates D1: until D9: of disk devices (access to 9 partitions at one time)
* full bootable from any partition (with standard XL-OS)
* write protectition capability
* supports master/slave configuration
* more than 30 KB/s file access with SPARTA-DOS 3.2 gx (reading)
* more than 10 KB/s file access with SPARTA-DOS 3.2 gx (writing)
* software partially supports CD-ROM and ZIP drives.
Sold out.
http://www.birmanns.de/atari/

==> Gary Morton's BadSector"A" Project
Wants to connect his IDE drive to the SIO bus.
http://www.alma.demon.co.uk/Atari/AtariProjects.html

==> MyIDE interface and software by Mr.Atari, Sijmen Schouten
Point-to-point wiring project. Different units for 800 and XL, including a
cartridge version for the XL.
http://home.wanadoo.nl/mr.atari/

==> SIO2IDE, by Marek Mikolajewski (MMSoft)
The SIO2IDE is a simple interface that allows you to attach any IDE Disk
Drive to your 8-bit Atari computer. Latest interface version has the
following main features:

* ATARI side:
- uses standard Atari SIO at a speed of 19200 baud
- works with Atari High Speed SIO (US and Happy) at a speed of 52000 baud
- emulates Atari disks D1: to D8:
- can be used with any Atari DOS and OS
- can be used without any problems with other SIO devices (disk drivers,
printers, modems, SIO2PC, second SIO2IDE etc)
- can be easy installed inside your Atari with 2.5' laptop HD
- is easy to configure via special fdisk.com utility software
(changing disks sequence and active directory)
* IDE device side:
- all IDE ATA/ATAPI devices can be used: Disk Drives (2.5' and 3.5'),
CD-ROMs, Compact Flash cards etc.
- supports PC file systems, FAT16 and FAT32
- supports CD file system, ISO9660
- supports ATR disk images (SD, DD up to 16MB)
- supports directory change (multiconfig)
- is easy to configure, many text configuration files (sio2ide.cfg) can
be stored in different directories
- disk configuration can be checked by special checkfs.exe PC utility
NOTE: checkfs.exe does NOT work with HDD connected via USB port
- standard disk utilities can be used (defrag.exe, scandisk.exe etc)
* USB port side:
- interface works as Mass Storage Class device (removable drive)
- no drivers are needed for Windows 2K, ME, XP
- driver for Win98 is included in this SIO2IDE package

http://www.atari.cuprum.com.pl/sio2ide.htm

==> Nathan Hartwell's IDE projects
http://www.magelair.com/

Subject: 4.1) What are the Atari 820, 822, and 825 Printers?

The following printers were produced by Atari and styled to match the 400/800
computers.

Atari 820 Printer:
- 40-column impact printer
- 5x7 dot matrix
- 40 characters per line, upper & lower case alpha
- horizontal and vertical alphanumeric characters
- 6507 microprocessor, 6532 RAM I/O chip, 2K ROM
- 40 characters per second
- uses Standard Roll Paper/adding machine paper

Atari 822 Thermal Printer: (= Trendcom Model 100)
- 37 characters per second
- 10 characters per inch
- 40 characters per line, upper/lower case and point graphics
- 5x7 dot matrix

Atari 825 80-Column Printer (= Centronics 737)
- 3 character sets:
monospaced 7x8 dot matrix at 10 characters per inch
monospaced condensed at 16.7 cpi
proportionately spaced Nx9 dot matrix at avg of 14 cpi (N=6..18)
- all characters can be elongated (printer double width)
- characters per line: 80 at 10 cpi; 132 at 16.7 cpi
- speed: 50 cps at 10 cpi; 83 cps at 16.7 cpi; 79 cps avg. proportional
- print buffer: 1200 dot columns
- paper: roll, fanfold, or cut sheets
- requires Atari 850 Interface Module or equivalent

Subject: 4.2) What are the Atari 1020, 1025, 1027, and 1029 Printers?

The following printers were produced by Atari and styled to match the XL
series computers.

Atari 1020 Color Printer:
(= Commodore 1520 / Oric MCP40 / Tandy/Radio Shack CGP-115 /..; made by ALPS)
- 4-color graphics: (black, red, blue, green). optional 8-pen rainbow package
- alphanumberics and X,Y plotting capability
- 10 cps (40-column mode)
- 20, 40 and 80-column modes
- horizontal and vertical alphanumerics, English and International chr sets
- water soluble ink pen technology
- 4-pen barrel print head
- microprocessor
- paper: standard roll paper (40 column width)
- AtariGraphics cassette software included

Atari 1025 80-Column Printer: (= Okidata ML80)
- 40 cps (80-column 10 cpi mode)
- 5 cpi expanded (40 col), 10 cpi (80 col), 16.7 cpi condensed (132-col)
- 5x7 character dot matrix
- buffer: 132 chrs at 16.7 cpi, 80 chrs at 10 cpi
- paper: roll,fanfold,single sheets. optional:roll paper holder, tractor feed

Atari 1027 Letter Quality Printer: (= Mannesmann Tally Riteman LQ.)
- fully formed characters, prestige elite 12)
- 12 characters per inch (80 columns)
- 20 characters per second
- single sheets or roll paper

Atari 1029 Programmable Printer (by Seikosha)
- 7-pin dot matrix, same as Commodore MPS-801
- Released for Europe & Canada (not USA)
- Rich_N_Feymus says:
I think its a SEIKOSHA GP500, but not 100% sure. However, the
Commodore MPS-801 ribbons should be much easier to find.
- The Tandy DMP 110 is another model reported to be the same as the 1029.

Subject: 4.3) What are the Atari XMM801 and XDM121 Printers?

The following printers were produced by Atari and styled to match the XE series computers.

Atari XMM801 Printer: (= SHINWA CP80)
- 80 columns, dot matrix
- friction feed or pin feed
- pica 10 cpi, double width pica 5 cpi, elite 12 cpi,double width elite 6 cpi, condensed 16.5 cpi, double width condensed 8.25 cpi
- Ribbon: Commodore 1526 and the Mannesman-Tally Spirit 80

Atari XDM121 Printer:
- 80 column, daisy wheel--letter quality
- underlining, subscripts, superscripts
- friction feed paper
- Ribbon: Silver Reed CF130, Olivetti ET201,ET221,Nu-Kote NK136

Subject: 4.4) What other printers can I use with my Atari?

Some third-party printers were marketed for use with the Atari 8-bit computers:

Alphacom 42 + Atari interface cartridge
- requires 850 Interface or equivalent
- thermal
- 4 1/2" width paper
- supports complete ATASCII character set

Axiom AT-100 / Seikosha AT-100 / Seikosha GP-100A Graphic Printer
- built-in Atari interface, cable and connector, 2nd SIO port for daisy-chain
- dot matrix
- early model 30-cps, later version 50 cps
- Graph-AX graphics software package

Axiom GP-550AT (by Seikosha)
- built-in Atari interface, cable and connector, 2nd SIO port
- dot matrix
- 86 cps draft, 43 cps NLQ
- Graph-AX graphics software package

Axiom GP-700AT (by Seikosha)
- built-in Atari interface, cable and connector, 2nd SIO port
- 4 hammer print heads, 4-color ribbon cartridge
- 25 colors
- 50 cps
- Graph-AX graphics software package

Epson HomeWriter 10
- plug-in cartridge interface for the Atari
- 80 column dot-matrix printer
- draft quality printing at 100 cps and near letter quality at 16 cps

General Electric GE 3-8100 / TXP 1000
- GE Printer Interface Module for Atari
- dot-matrix
- 50 cps draft, 25 cps NLQ

Okidata Okimate 10 Personal Color Printer
- available Plug 'n Print Interface for Atari
- a thermal printer.
- single-sheet or tractor-feed paper.
- 26 colors
- 240 words per minutes

Beyond the above printer models, most any "industry-standard" line printer can work well with the Atari. For many years, most printers marketed for home use could be classified into one of two categories: parallel or serial interface. Parallel line printers are much more commonly used than serial line printers, with the Epson MX/FX/LX series defining the market.

The most common way to use an industry standard printer with the Atari has been to attach it through the 15-pin 8-bit parallel port of the Atari 850 Interface Module or equivalent (such as the ICD P:R: Connection). One gotcha here is that the 850's parallel port is DB15, where the PC world ended-up standardizing on a DB25 configuration. So you need to find or build a cable that provides the DB15 connector for the Atari end (and Centronics-type parallel connector on the printer end) when attaching a standard parallel printer to the Atari through an Atari 850 or equivalent.

Many 3rd-party disk drives for the Atari (along with the XEP80 Interface Module) do include a DB25 parallel printer port, rendering the need for an Atari-specific printer cable unnecessary.

The Atari 850 Interface Module and equivalents also provide standard DB9 serial RS232C ports, permitting use of standard serial line printers with the Atari. But this is much less common than parallel, both in the Atari world and in the industry at large.

Some folks have connected more modern inkjet and laser printers with parallel connections to the 8-bit Atari with success. Graphics printouts from the Atari may be less than ideal (look for a printer with an Epson MX/FX/LX printer series emulation mode), but these types of printers should work fine for plain text output if they can handle simple line print jobs. Anyone want to contribute their experiences to be included here?

Bob Woolley wrote on Sun, 14 Apr 2002:
I use HP LaserJet 4Ps on my Ataris. They are one of the last front panel selectable cheap printers - from which you can select your default fonts, etc. The newer laser printers can only set fonts and operating modes thru the interface, not impossible, but not as easy as selecting on the panel. This does allow you to print just about any point size of the internal fonts in the printer on your Atari.

Either way, you really have to do a little work to get properly formatted output from a word processor. I have managed to use the proportional font setting with AtariWriter and printer driver creation utilities to get good

results.

Mathy van Nisselroy provides an AtariWriter printer driver for the HP LaserJet
here: http://www-users.rwth-aachen.de/mathy.van_nisselroy/stuff.htm

Modern printers designed for home markets now tend to provide USB connectors.

Subject: 5.1) What are the Atari 830, 835, 1030, XM301, and SX212 Modems?

A MODulator/DEModulator translates digital information from your computer into
acoustic tones that can be sent and received, from modem to modem, via
standard telephone lines.

Atari produced several modems for use with the 8-bit Atari computers:

Atari 830 Acoustic Modem: (= Novation 'CAT')
- a stand-alone, acoustically coupled, frequency shift keying (FSK) modem
- up to 300 bits per second
- Bell 103/113 modem compatible
- requires Atari 850 Interface Module or equivalent

Atari 835 Direct Connect Modem:
- 300 bps
- Bell 103/113 modem compatible

Atari 1030 Direct Connect Modem:
- 300 bps
- Bell 103/113 modem compatible
- built-in ModemLink software.
- 2 SIO ports

Atari XM301 Modem:
- 300 bps
- Bell 103/113 modem compatible
- with XE Term disk software
- permanent SIO cable, must be at end of SIO chain
- draws its power from the computer via SIO

Atari SX212 Modem:
- SIO & DB25 RS232 serial ports, must be at end of SIO chain
- 1200 baud
- Bell 103/113/212A modem compatible
- rarely with SX-Express! disk software.

Subject: 5.2) What other modems can I use with my Atari?

Some third-party modems were marketed for use with the Atari 8-bit
computers:

==> Microconnection, by Microperipheral Corp.
300 bps, Bell 103 compatible, T-SMART software, pulse dialing (not touch tone)

Four versions:
buss-decoding version does not require 850 Interface or equivalent, includes
DB25 parallel printer interface, with or without autodial
Plain version requires 850 Interface or equivalent, with or without autodial
and autoanswer

==> MPP-1000C, by Microbits Peripheral Products
300 baud, joystick port 2, Smart Terminal cartridge

==> MPP-1000E, by Microbits Peripheral Products
300 baud, joystick port 2, Smart Term software
From: "Steven J Tucker" Sun, 13 Jan 2002 16:14:38 -0500
The 1000E..had this strange problem in that it could never hang up the phone

==> MPP-1200A, by Microbits Peripheral Products
Released? Vaporware?
1200 bps, joystick port 2

==> 300 AT, by Supra (same as MPP-1000E)
300 baud, joystick port 2, Smart Term software

==> 1200 AT, by Supra
1200 baud, Hayes compatible, connects to SIO via SupraVerter/R-Verter cable,
Smart Terminal software

==> Volksmodem, by Anchor Automation
300 baud, 'F' Cable permits connection to joystick port 2

==> Q-MODEM, by Quantum Microsystems
300 baud, two SIO connectors, QuanTerm disk or cartridge

Beyond the above modem models, most any "industry-standard" external serial modem can work well with the Atari. These have been commonly sold for PCs for many years. The Hayes Smartmodem more or less defined the market for these, initially.

One common way to use an industry standard external serial modem with the Atari is to connect it to the SIO port via an Advanced Interface Devices (A.I.D., later Supra) R-Verter Serial Bus Modem Adapter cable, or equivalent.

The other common way to use an industry standard external serial modem with the Atari is to attach it through the 9-pin RS232C serial port of the Atari 850 Interface Module or equivalent (such as the ICD P:R: Connection). One gotcha here is that the serial port on the 850 is DB9 female, where the PC world ended up standardizing on a DB9 male connector for this purpose. But gender converters are readily available.

For using modems at speeds of 2400 bps and up with the Atari, it will be useful to have an understanding of data flow control. Here is a definition of flow control from www.modems.com:

Often, one modem in a connection is capable of sending data much faster than the other can receive. Flow control allows the receiving modem to tell the

other to pause while it catches up. Flow control exists as either software, or XON/XOFF, flow control, or hardware (RTS/CTS) flow control. With software flow control, when a modem needs to tell the other to pause, it sends a certain character, usually Control-S. When it is ready to resume, it sends a different character, such as Control-Q. Software flow control's only advantage is that it can use a serial cable with only three wires. Since software flow control regulates transmissions by sending certain characters, line noise could generate the character commanding a pause, thus hanging the transfer until the proper character (such as Control-Q) is sent. Also, binary files must never be sent using software flow control, as binary files can contain the control characters. Hardware, or RTS/CTS, flow control uses wires in the modem cable or, in the case of internal modems, hardware in the modem. This is faster and much more reliable than software flow control.

Some 2400 bps modems, and probably all modems with 9600 bps speed capabilities and up, normally use V.42 standard error correction and V.42bis standard data compression. But V.42 requires either software or hardware flow control, and V.42bis requires hardware flow control (and V.42 error correction).

Hardware flow control is not available with the Atari 850's serial ports.

As a result, just before dialing out with your Atari telecom software, it's usually desirable, if not necessary, to disable your modem's flow control.

The Hayes modem command to disable flow control looks like:
AT&K0

The top speed of the Atari 850's serial ports is 9600 bps.

Clay Halliwell offers a tip on utilizing 9600 bps through the 850 Interface:
On 11 Feb 1996, Marc G. Frank said:

> I'm having problems getting a modem attached to my Atari 850 to
> communicate at 9600 baud. When I set my communications program to 2400
> baud, everything works fine. However, when I set it to 9600 baud, the
> modem echoes my characters but doesn't act on them. That is, at 2400,

The problem with the 850 is that some of them (like mine) don't produce a PERFECT 9600 baud signal. As a result modems can't train on it, and while they will echo characters back, for some nitpicky reason they won't pick up on the "AT" attention code.

The solution is to do all your dialing at 2400 baud, but set the S37 register to force the modem to try to connect at 9600. Then switch your Atari to 9600 after connecting.

Through the use of an ICD MIO or a CSS Black Box, it is possible to utilize modems at speeds up to 14.4 Kbps (V.32bis) at full speed with no loss of data. The serial R: device handler for the Black Box supports hardware flow control natively. Optional for the Black Box, but essential for the MIO, is the HyperSpeed handler by Len Spencer.

Hyperspd.arc is available at http://members.aol.com/lenspencer/atari8.htm

---

Subject: 6.1) What is the Atari 850 Interface Module?

While the Atari's SIO and controller ports did not conform to established industry standards, Atari produced the 850 Interface Module to address this issue. The 850 connects to the SIO port on the Atari, and provides:

- four 9-pin serial EIA RS232C ports
- One 15-pin 8-bit parallel Centronics-type port

Many "industry standard" (of the time) printers, modems, and various other devices can be used with the Atari computer in combination with an 850 Interface Module.

Early 850's are in an all metal (black) case, but most are in a plastic beige case matching the 400/800 computers. Other features:
- programmable baud rate on any port, including:
75, 110, 134.5, 150, 300, 600, 1200, 1800, 2400, 4800, and 9600 bps;
baudot speeds of 60, 66, 75, 100 words per minute
- uses standard ASCII. Baudot support for radio-teletype (RTTY).

PINOUTS

Because the 850 was relatively expensive, provided more capabilities than the average user was looking for, and was at times unavailable from Atari despite high demand, there were many 3rd-party interfaces designed to provide some compatible subset of the 850's features. Perhaps the most prominent example of such a product is the P:R: Connection from ICD.

Subject: 6.2) What is the Atari XEP80 Interface Module?

This text written by Thomas Raukamp.

Since the development of the Atari 8-bit line of computers in 1979, users wanted better text displays than the default 40x24. There has been some attempts to satisfy this need, like the Austin-Franklin board or the Ace 80/80xl cartridge. For more informations about these modifications read The Atari 8-bit Hardware Upgrade FAQ from David A. Paterson.

The Atari XEP80 Interface Module is Atari's entry to the 80 column field. It lets a XL, XE, 400 or 800 computer system display a full 80 columns across your monitor screen. The XEP80 provides a 256-character wide by 25-line display window. Up to 80 characters are displayed horizontally at once, and you can scroll horizontally all the way to the 256th character, depending on

the application you're running. The XEP80 is connected to your system via a joystick port.

The XEP80 Module interprets commands from the computer for screen display or output to a printer. The module is supplied with an industry-standard 8-bit parallel port so you can connect a parallel printer to your Atari 8-bit (I even use a HP LaserJet IV on my 130XE ;)).

All programs that use the standard screen call (E:) should be compatible with the XEP80 Module. The software provided by Atari supports a 320x200 graphics mode - this mode only support direct bit images. Note that you can't use all of the standard graphic capabilities of the Atari anymore.

Although Atari recommends a monochrome monitor for usage with the XEP80, it runs fine with any type of composite monitor. The output looks great on my Commodore 1084 for example.

Along with the module comes a software-package containing an AUTORUN.SYS file, which is the XEP80 handler. If you want to use the module with an application that is compatible with the XEP80, which has it's own AUTORUN.SYS file, you can append the application's AUTORUN.SYS on the module's AUTORUN.SYS.

Subject: 6.3) What accessories did Atari produce for their 8-bit computers?

This should be a complete list of Atari "CX" accessories, two or three digit numbers, marketed for use with the 8-bit computers.

CX30-04 Paddle Controller Pair
CX40-04 Joystick Controller Pair
CX40 Single Joystick Controller
CX41 Joystick Repair Kit
CX22 Trak-Ball Controller
CX23 Kid's Controller
CX24 Pro-Line Joystick
CX42 Remote Control Wireless Joysticks

CX50 Keyboard Controller Pair
CX70 Light Pen (beige; the original Atari light pen)
CX75 Light Pen (+ Atarigraphics cartridge)
CX77 Touch Tablet (+ AtariArtist cartridge)
CX78 Joypad (shipped with the 7800 in Europe)
CX80 Trak-Ball
CX81 I/O Data Cord (5 ft)
CX82 Monitor Cable (Black and White Monitor)
CX85 Numerical Keypad (+ software Handler on diskette)
CX86 Printer Cable (included with 825 Printer)
CX87 Interface/Modem Cable (included with 830 Acoustic Modem)
CX88 Interface/Terminal Cable (null modem)
CX89 Monitor Cable (Color Monitor)
CX418 The Home Manager Kit (Personal Financial Management, Home Filing Manager
-or- Family Finances, The Home Filing Manager)
CX419 The Bookkeeper Kit/Atari Accountant (The Bookkeeper disk, CX85 keypad)
CX481 The Entertainer (Star Raiders, (Missile Command or Pac-Man),2 joysticks)
CX482 The Educator (410, BASIC cart., States & Capitals cassette)
CX483 The Programmer (BASIC, BASIC Ref. Manual, BASIC Self-Teaching Guide)
CX484 The Communicator (850, 830, TeleLink I cart.)
CX488 The Communicator II (835, TeleLink II cart.)
????? The Arcade Champ (Pac-Man, Qix, 2 joysticks, cartridge storage case)
????? The BASIC Tutor I (Inside Atari BASIC bk,Invitation to Programming 2&3)
CX852 8K RAM Memory Module (for 800 computer)
CX853 16K RAM Memory Module (for 800 computer)
XG-1 Light Gun (+ Bug Hunt cart.)

Subject: 6.4) What "vaporware" computers/peripherals were never released?

Atari was a HUGE company, dominating Silicon Valley, and included a massive
research and development department which famously designed many, many
products that never saw the light of day. Here is a brief listing of many
Atari hardware model designations known to have existed internally to the
company, but which were never sold and are extremely rare (if they ever
existed at all). For definitive information on unreleased Atari products,
see:

Atari Historical Society, http://www.atari-history.com/ (Curt Vendel)

Atari 8-bit vaporware computers: (note some are more vaporous than others)
800D (Developers Bus System)
1000 Sweet 16 Project, lower end model. Became the 1200XL
1000-X Sweet 16 Project, higher end model. Became the 1200XL
1200 1200XL internally, many slight cosmetic differences
1200XLS 1200XL Show prototype, top-mounted cartridge slot
600 early 600XL, all black case, joyports on the left, missing PBI
800XL brown prototype
800XLD low-cost 1450XLD,no modem&speech,incl disk drive controller&FREDDIE
800XLCR Cost Reduced, with CGIA chip ("Keri"), which is a combined GTIA&ANTIC
900XLF early name for 65XE

1250XLD Earlier name for the 1450XLD
1400XL brown prototype
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XL 1400XL plus room for 2 internal 5.25" drives(controller not included)
1450XLD 1400XL plus 5.25" floppy drive (Epson SD521 360K disk drives)
1600XL Amiga/Amiga-like.Now appears that 1850XLD was the model name for this
1650XLD to use 1450XLD case and 1200XL keyboard
1850XLD "Mickey" Atari clone of the Amiga Lorraine
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMY sound chip

Atari 8-bit vaporware peripherals: (note some are more vaporous than others)
1027 PLUS -daisy-wheel, 80 columns
1053 -looks like a 1050, but supports DS/DD 360K format
1055 -a 1050 (SS/ED) with a 3.5" mechanism
1060 CP/M Add-On Module -"SweetPea" Z-80 CPU, 64K RAM, CP/M 2.2, 80col display
1090 XL Expansion System-5 PBI slots, CP/M/MS-DOS/Apple II compatible
XM128 -12" green monitor w/ built-in 80-column card
XC1411 -composite 14" color monitor (Goldstar)
XF521 -5.25" floppy drive - 1050 compatible, in XE style
XF351 -a 3.5" drive.
XC35 -an XF551 with a 3.5" mechanism
XTM201 -non-impact printer
XTC201 -XE Thermal Color Printer

Subject: 6.5) What are the power requirements for my Atari components?

Thanks to Matthias Belitz for the European data in this section. I need more
international help!

As with the rest of this FAQ list, please let me know if any of this
information conflicts with the units you have.

The most important information is the voltage (in volts) required, and
whether you need a transformer (AC output) or an adapter (DC output).
The power (in voltamps or watts) and current (in amperes) specifications
of the original equipment as presented here should be regarded as
minimum values. Higher-than-specified power and current capacities are
entirely usable, and often preferable because such supplies run cooler
and last longer.

Direct Current (DC):
Power (in watts) = current (in amps) * voltage (in volts)

Alternating Current (AC):
Apparent Power (in voltamps) = current (in amps) * voltage (in volts)
Effective/True Power (in watts) = current (in amps) * voltage (in volts)
* (cosine of the angle of lag)

N O R T H A M E R I C A INPUT = 115-120 V AC, 50/60Hz

MPP1000C modem: 9 V DC 200 mA (1.8 W)

Subject: 6.6) What graphic tablets were produced for the Atari?

This section by Andreas Magenheimer.

- Atari Touch Tablet by Atari (came with Atari Artist cart., Micro Illustrator compatible),
- Koala Pad by Koala Industries (came with Koala/Micro Illustrator cart.);
- Powerpad by Chalkboard Inc. (came without software!); the following carts were available separately for the Powerpad: Micro Illustrator, Leo's Lectric, Micro Maestro, The Programmers Kit, Logic Games, Bear Jam (as refered to Antic, September 1984);
- Animation Station by Suncom (came with Micro-Illustrator cart.);

Subject: 6.7) What lightpens were produced for the Atari?

This section by Andreas Magenheimer.

- Atari Lightpen (came with Atari Graphics cart.; it produces pictures with 127 sectors in length, thus not Micro-Painter, nor Micro-Illustrator compatible; however appropriate converter programs can be found in the public domain, e.g. the Rapid Graphics Converter);
- Edumate Lightpen (came with a disk with 6 Basic programs; a program called Peripheral Vision was available separately from Future House);
- Tech-Sketch-Lightpen (came in two versions: a) the cheaper version which included a disk with Basic programs only and b) the more expensive version which included the disk with Basic programs and the Micro-Illustrator cartridge);
- MC-Pen-Lightpen (came with a disk with 4 Basic programs);
- Reston Lightpen (came with ???);

Note: these infos were taken from Antic, September 1984; I am not sure, if all these items were really available as listed...

Subject: 6.8) What lightguns were produced for the Atari?

This section by Andreas Magenheimer.

- Atari LG-1 Lightgun (came in two versions: a) complete with XEGS, keyboard, joystick, power supply, tv-cable, Lightgun, FS II cart and

Bug Hunt cart all in one package and b) in a separate package,
containing the Lightgun and the Bug Hunt cartridge); thats's why Bug
Hunt does not have its own package, it was always included with the
Lightgun package and/or the complete XEGS package...
- BEST Lightgun by Best Electronics (a sort of selfmade (?) Lightgun);
- Sega-Lightgun (normally not Atari compatible; but can be converted
into an Atari compatible lightgun easily);
- other lightguns (most of these have to be converted)...

Note: After having 3-4 Atari and at least one (converted) Sega lightgun,
it is my personal impression, that the Atari lightgun merely works ok
on/with TV-sets (and not at all with a monitor), whereas the Sega lightgun
works alright on TV's and (most) monitors. Since I never had a Best
lightgun I cannot comment on this one... (Andreas Magenheimer);

Subject: 6.9) What paddles were produced for the Atari?

This section by Andreas Magenheimer.

- Atari Paddles (usually a pair of Paddles);
- Telegames Paddles (available as a) a single paddle and b) a pair
of paddles);
- Reston Paddles (available as a) a single paddle and b) a pair
of paddles);
- and many others...

Note: Both single and duo (pair) paddles are compatible to each other,
using only one port-connector (only one joystick port). Thus, with a pair
of paddles you can connect up to 4 paddles (2 pairs) to the XL/XE models
and up to 8 paddles (4 pairs) to the Atari 400/800 models.

Subject: 6.10) What voice/sound synthesis hardware was produced for the
Atari?

This section by Andreas Magenheimer.

- Voice-Box II by The Alien Group (a software and hardware package);
- 1400XL/1450XLD Voice Synthesizer (built-in chip inside the extreme rare
Atari 1400XL/1450XLD models);
- Talk is Cheap by Ed Stewart, Antic Volume 2 Number 4, July 1983,
pages 64-66; hardware schematics only (a test/demo program is
mentioned in the text, but not printed in the magazine!);
- Cheap-Talk by Lee Brilliant, Analog Computing, issue 29, April 1985,
pages 59-67; hardware schematics and software demos, for example
"First Words");
- many other voice synthesizers (mostly selfmade and based on a chip by
National Semi Conductor);

Subject: 6.11) What sound-digitizers/samplers were produced for the Atari?

This section by Andreas Magenheimer.

- Parrot (2-Bit) by Alpha Systems, Anthony Ramos;
- Parrot-2 (2-Bit or 4-Bit?) by Alpha Systems, Anthony Ramos;
- 2-Bit Replay (2-Bit) by 2Bit-Systems Ltd.
- Sound N'Sampler (2-Bit) by Ralf David;
- Sound Digitiser (2-Bit) by Ralf David;
- Sound-Meister (2-Bit) by Irata;
- Sound-Digitizer (2-Bit) by Irata;
- Digitales Mikrofon (2-Bit) by Compyshop;
- Voice-Master (2-Bit) by Covox Inc.;
- Analog-Sample-Processor (2-Bit) by Steven Lashower (Analog Magazine);
- Atari-Sound-Sampler (2-Bit) by Andreas Binner and Harald Schoenfeld (german Atari magazin 1/1989, pages 44-49, complete with schematics, documentation, sample-program and assembler-source);
- Alphasys-Sound-Sampler cart. (4-Bit) by ANG/Mirage (released as a mono version; a stereo (two Pokeys!) version was promised/planned, but afaik never released);
- ARGS-XE-Sampler (8-Bit) by ABBUC regional group ARGS (only one or two prototypes exist, alas the hardware was never released due to lack of (sampling/digitizing) software; maybe a good idea for the hardware and software experts out there!);
- and many others ...

Subject: 6.12) What sound-enhancement upgrades were produced for the Atari?

This section by Andreas Magenheimer.

a) enhancements for stereo-sound:

- POPS, polyphonic-pokey-sound by Lee Brilliant (stereo-support with one Pokey!); refer to Analog Computing, issue 66, november 1988, pages 54-60; only 1-2 programs exist for this mod., see: 8.14 stereo-software for the Atari;

- stereo with two Ataris (and thus 2 Pokey chips); use computer/pokey 1 for the left channel and computer/pokey 2 for the right; no special hardware required for this trick (but specially programmed software!); see also: 8.14 stereo-software for the Atari;

- stereo with 2 Pokey chips (in one Atari!); refer to an article written by Chuck Steinman (which probably appeared in Atari classic?) on how to upgrade your Atari internally with a second Pokey chip; or ask Freddy Offenga for a deluxe-stereo-version, that uses a PCB instead of the piggy-back method. For a list of software that supports this mod. see also: 8.14 stereo-software for the Atari;

- Stereo-Blaster and Stereo-Phaser by Portronic/AMC-Verlag, these were hardware add-ons that connected via the monitor jack to the Atari and gave you "another" monitor jack and 2 cinch connectors to connect to

the monitor and/or the hifi-system; various small paddles (4-10, depending on the model you have) make it possible to change amplitudes, frequencies, etc. and thus generate a "pseudo-stereo" sound. These add-ons also amplified the sound and thus made quality recordings of Atari sounds much easier. Alas, these hardware add-ons were quite expensive and thus not many (less than 100) were sold. Therefore no special software is required, every A8 sound can be changed or enhanced to "simulated-stereo"...

- Stereo-Blaster-Pro, a hardware add-on by Portronic/AMC-Verlag similar to Stereo-Blaster and Stereo-Phaser, but programmable! This add-on had only 1 small paddle, to amplify the sound-volume; the stereo-sound could be generated via two simple Poke-Statements, a demo-disk therefore was included. Alas, not many items were sold and afaik no-one else programmed stereo-software for it. See also: 8.14 stereo-software for the Atari...

b) other sound enhancements:

- Covox-Sound-Enhancement, originally developed in Poland; with some electronic parts and pieces you can upgrade your Pokey's abilities, to playback any digitised/sampled sound with 8-Bit resolution, instead of its usual 4-Bit digi/sample playback resolution (see also 8.14).

- SID-upgrade, the SID is the standard sound-chip in the C64 computers. Some polish freaks/nerds have found a way to include it into an A8, but allthough I have seen quite a lot of pictures (for example at atariarea.nostalgia.pl) with this mod. and already found 1 or 2 programs that detect it (for example System Info 2.x by Draco), I have not yet found any schematics for this upgrade. Anyway, it exists, and with some programming skills it would surely be possible to write programs then, that playback SID sounds on those Ataris which have this upgrade installed...

- Amie/Amy sound-chip, the Amie sound-chip was originally produced by Atari and installed into the 65XEM computer. Alas, it was never available to the public and only very few prototypes of this 65XEM (maybe less than 10?) do exist. Besides of that RUMOURS say, that Atari had quite some problems with this soundchip and never finished it completely/successfully. If the rumours are true, then this soundchip provided many more sound channels, more octaves and even more and better sound power than two Pokeys together (for more infos take a look at this URL:)

- guess there are dozens of other sound enhancements, for example sound cards (like Adlib, etc.), sound-chips, midi-interfaces, etc. that could be attached or converted to the A8; I won't name them all here...(A.M.)

Subject: 6.13) What MIDI enhancements are there for the Atari?

This section by Andreas Magenheimer and Mathy van Nisselroy.

Midi is standard on the Atari ST computers, because it is built-in into these computers. Nevertheless, Midi was long before the arrival of the ST computers on the market and thus, it is no surprise that there are even midi-interfaces and enhancements for the classic 8Bit Ataris. The following "types" do exist:

- "Midi-Mate" and "Midi-Track" by Hybrid Arts (USA), comes with hardware + software, see reviews & tests in Antic, Analog and other magazines. MidiTrack requires 48k RAM, MidiTrack II 64k RAM and MidiTrack III 128k RAM (XE compatible, not Axlon compatible). MidiMate features MIDI IN+OUT and SYNC IN+OUT ports, but lacks a second SIO plug. MMS (MIDI Music System) is a MIDI version of AMS, also sold by Hybrid Arts and comes with AMS to MMS converter software...

- "MIDI Master" by 2-Bit Software (UK), comes with hardware+software. Features MIDI IN+OUT ports, an extra SIO plug, but no SYNC ports. See also reviews and ads in (New) Atari User...

- "MIDI interface" by DIGICOMM (UK), comes with hardware + 'example programs'. Features MIDI IN, THRU and OUT ports. There`s no word about a second SIO plug or any SYNC ports. See also reviews and ads in (New) Atari User...

- "MIDIMAX" by Wizztronics (UK), comes with hardware and software. Features MIDI IN+OUT ports and a second SIO plug. The MMS software that comes with MidiMax requires 48k RAM and is fully compatible to the Hybrid Arts hardware+software. This means, one can use the software with both Midi-interfaces or use the interfaces with the software of both vendors...

- "Atari-Midi-Interface" by Karlheinz Metscher (appeared in the german magazine Computer Kontakt June/July 1986, pages 69-75, complete with documentation, schematics and its first program "Midi-Receiver"; in Computer Kontakt October/November 1986 appeared the second program, called "Midi-Disk" - a Midi Recorder and Player program);

- "Midi-Interface for Atari XL/XE" by Ireneusz Kuczek (appeared in the german ABBUC magazine, issue 65, pages 3-6); the paper-mag. includes a schematic for the midi-interface and some translated descriptions for the software (translated from polish to german language), whereas the disk-magazine contains the midi-programs "Midiplay Version 1.3" by I. Kuczek, "Midi-Recorder Version 1.2" by I.Kuczek, "Rec to Mid" by I. Kuczek (a converter program for the IBM-PC!), "Midi-Sequencer V.1.15" by Maciej Sygit and "Midi-Pattern-Editor MPE V.2.3" by Radek Sterba. These programs and many additional demo sounds are also available in the ABBUC PD library (PD numbers 625-632).

- guess there are several other (selfmade) midi-interfaces for the Atari 8Bit available, alas they also require a keyboard or synthesizer and self-created (or downloaded) midi-sounds can only be played back via such a midi-interface and the affore mentioned keyboard/synthesizer. As of yet, it seems there exists no midi-player program, that can playback any midi-sound via the Atari Pokey chip, nor any converter

program, which can convert *.MID sounds into other Atari sound formats
(that could be played back on the Atari then)...

Subject: 6.14) What graphics enhancements are there for the Atari?

This section by Andreas Magenheimer.

- some 80 column interfaces made by Atari and third parties. Allthough
these interfaces are there to provide a better text display with 80
chars. per line, they can somehow be used as a simple graphic
enhancement; think I have seen a graphic demo for the XEP-80 device
somewhere, that used a higher graphic resolution in Gr. 0 or Gr. 8
and also provided some animation (not only text, but also graphics),
alas I don`t remember the name of that demo...;
- the ultra-rare 1090XL box and probably graphic cards for it (who-ever
owns this item, doesn't use it, who-ever would like to have + use it,
doesn't own it or cannot afford it!);
- more seriously: Antic and GTIA upgrade by Chuck Steinman. Afaik, an
article about that topic appeared in Atari Classic, since I do not own
it, I can merely speculate that it adds a second Antic and GTIA for
higher resolution and/or more colours...;
- many selfmade upgrades, using graphic chips or graphic cards from other
computers...

Subject: 6.15) What types of memory upgrades are there for the Atari?

This section by Andreas Magenheimer.

Just a short overview here, for a more detailed description (table), see
also 8.10 kinds of atari ramdisks (and 8.11 + 8.12 for programs that
support or require a ramdisk). The following memory enhancements do exist:
- Atari 400/800: ramdisks on memory boards, that fit into the normal
Atari 800 memory slots (Axlon and Mosaic types);
- Atari XL/XE: a) internal memory enhancements:
- piggy-back versions,
- professionel PCB versions,
- SIMM-module versions;
b) external memory enhancements:
- via XL-Parallel-Bus,
- via XE-Cart.port+ECI,
- Flash-ROM cart. versions,
- other Cartridge versions,
- RAM-Card versions,
- SIO-cartridge versions,
- ...
Note that many of these XL/XE memory enhancements are just hobbyist or
selfmade-projects. Most versions which use newer PC technologies
(Flash-ROM cart., RAM-Card, SIO-cart., etc.) are still under development!

Subject: 6.16) What networking hardware is there for the Atari?

This section by Andreas Magenheimer.

In the late 80`s and early 90`s an american "firm" called Dataque developed some networking-computer-hardware to link two or more Ataris together, so that multiplayer games are possible, where each user has its own computer and tv/monitor screen. The hardware was/is computer independant and will run fine on any Atari 8Bit computer (whereas most software for it will only work on XL/XE computers). During a 3-4 year period of development two different hardware add-ons were developed:

a) Gamelink-1: This hardware was developed in 1989/90. It links two computers together via the joystick ports. It is limited to a maximum of 2 computers and thus 2 or 6 players, meaning one free port per XL/XE computer and 3 free ports per 400/800 computer. However, the few existing games for this hardware merely support 2 players, no matter, which computer you have...

b) Gamelink-2: This hardware was developed in 1991/92. It links 2 to 8 computers together via the SIO-port. One computer will then act as the master and has to boot up the software (from tape, disk, harddisk, etc.) first. Then all other "slave" computers connect to it and boot off of this master computer (one after another of course). In Europe we call this device "Multilink", mostly because of the games written by Bewesoft (Jiri Bernasek) called Multi-Dash, Multi-Race, Multi-Worms. A two-computer link-network can easily be done with one SIO cable, just open the end of the SIO cable and exchange cables number 3 and 5. You now have an easy two-computer (2-4 players) network-cable.

For some available software, that supports this networking-computer hardware, see 8.16 which programs support networking computer hardware...

Subject: 6.17) Can I attach an ISA card to the Atari?

Yes, RoBu (Roland Buhler) of the Stuttgart ABBUC Regional Group has produced project plans for an ISA-Bus Interface for Atari 800XL/130XE Computer, ARGS.
http://www.stud.uni-karlsruhe.de/~un55/Hardware/ISA-Interface/ReadME.html

Carsten Strotmann has released sourcecode showing how to access a Hercules video card with the ISA-Bus Interface.
http://www.strotmann.de/twiki/bin/view/APG/PgmFardwDriverHerc

---

Subject: 7.1) What versions of the Atari Operating System (OS) are there?

Most of this section by permission from:
http://www.student.kun.nl/f.offenga/atari.htm or
http://members.chello.nl/taf.offenga/atari.htm

Atari 8-bit Operating Systems
~~~~~~~~~~~~~~~~~~~~~~~~~~~~

Version 3.3, 6/27/1999.
By Freddy Offenga (taf.offenga [at] chello.nl (replace " [at] " with "@")

400/800 10kB OS roms
~~~~~~~~~~~~~~~~~~~~

2 XL/XE 05/10/1983 0x1f9cd270 CO61598B
3 800XE 03/01/1985 0x29f133f7 C300717
4 XEGS 05/07/1987 0x1eaf4002 C101687

(?) This information is missing. If someone can supply this info,
please write me an e-mail.

NOTES:
The 400/800 O.S's consist of three ROMs (two 4kB and one 2kB).
The 1200XL contains two ROMs for the OS (8k each), XL/XE's use a single
16k ROM and the 16k XEGS OS is stored in a 32k ROM (together with 8k
BASIC and 8k for Missile Command).

Origins of ROM information
~~~~~~~~~~~~~~~~~~~~~~~~~~
400/800 rev.A NTSC Could exist, since the PAL version exists and
rev.A is mentioned in the rev.B source code.
james adds (3/8/01):
Did exist! My parents bought me an Atari 400 w/ 410 back in 1981 for
entertainment when I was badly injured in a motorcycle accident. A
year or so later I paid good money ($40 USD or so?) to have the OS A
upgraded to OS B.
400/800 rev.A PAL All info found in two Atari 400's and Atari 800
ROM module CX801.P
400/800 rev.B NTSC Information from a ROM dump and the rev.B source
listing. The part numbers were listed in the
catalog from 'Best Electronics'. According to
'Mapping the Atari' rev.B ROMs have a 'B' at the
end of the part number, therefore I figure these
part numbers are from rev.B.

400/800 rev.B PAL Could exist, since the NTSC version exists and
there's some conditional PAL/NTSC assembly in
the rev.B source code
1200XL rev.10 PAL/NTSC All info found in an Atari 1200XL. The XL/XE
rev.2 source code refers to it as rev.10.
'Best Electronics' calls it rev.A.
1200XL rev.11 PAL/NTSC Refered to rev.11 by the XL/XE source code.
'Best Electronics' calls it rev.B.
XL/XE rev.1 All info found in an Atari 600XL
XL/XE rev.2 All info found in an Atari 800XL
XL/XE rev.3 All info found in an 800XE
XL/XE rev.4 All info found in an Atari XE Game System

O.S. Authors and dates
~~~~~~~~~~~~~~~~~~~~~
The following info is from the Atari XL/XE rev.2 source code.

Revision A (400/800)
D.Crane / A.Miller / L.Kaplan / R.Whitehead

Revision B (400/800)
Fix several problems.
M.Mahar / R.S.Scheiman

Revision 10 (1200XL)
Support 1200XL, add new features.
H.Stewart / L.Winner / R.S.Scheiman /
Y.M.Chen / M.W.Colburn 10/26/82

Revision 11 (1200XL)
Fix several problems.
R.S.Scheiman 12/23/82

Revision 1 (600XL/800XL)
Support PBI and on-board BASIC.
R.S.Scheiman / R.K.Nordin / Y.M.Chen 03/11/83

Revision 2 (600XL/800XL)
Fix several problems.
R.S.Scheiman 05/10/83
Bring closer to coding standard (object unchanged)
R.K.Nordin 11/01/83

Vapour-ware
~~~~~~~~~~~
The following OS roms originate from rare Atari 8-bit systems.
Since I don't own any of these (unfortunately), I don't have much
information about these roms. Who can help me?

I've got two 16K rom dumps from the 1450XLD. Both ID's are rev.3.
The first dated 3/23/1984 comes from the 'Pooldisk Too' CD-ROM
(filename: 1540os3.v0) and the second dated 6/21/1984 was send to
me by Nir Dary (filename: os1450.128). Main differences between

these two are in the first 3K ($C000 - $CBFF).

The XL/XE OS rev.3B is from an Atari from Arabia. It's probably based
on rev.3. There are changes in the fonts (Arab characters) and several
patches in the code. More info at:
http://www.savetz.com/vintagecomputers/arabic65xe/

Rev. Found in Size CRC-32 Date
~~~~ ~~~~~~~~ ~~~~~ ~~~~~~~~~~ ~~~~~~~~~~

~~~~~~~
Special thanks to Nir Dary for the rev.2 source code, rom dumps and
the 1200XL. It's in good hands.

~~~~~~
More info on what is maybe either the 1985 or 1987 XL/XE OS versions listed
above. From ST*ZMAGAZINE #36, Sept. 1, 1989 (as reprinted in PSAN Nov 89):
by Mark Elliot, Innovative Concepts
The following changes have been incorporated in the 130XE computer.

The O.S. has minor changes like:
A) The MEMORY TEST (from SELF TESTS) tests the extra 64K now! (in 4 squares)
B) Also, the MEMORY TEST checks the first 48K over TWICE as fast as before!
C) The KEYBOARD TEST has the F1-F4 keys missing on top. (function keys),
although the code that interprets them is probably there (like XEGS).
D) Also, it types out "COPYRIGHT 1985 ATARI" at the keyboard test, when all
tests are done. (compared to COPYRIGHT 1983 ATARI, before)
E) And, the O.S. chip itself, is on a 27256 EPROM, but only half of it is
used! (comprared to the original, which was on a 16K x 8 ROM, 27128 comp.
~~~~~~

Subject: 7.2) What is the ATASCII character set?

ASCII is an acronym for the American Standard Code for Information
Interchange. Pronounced ask-ee, ASCII is a code for representing English
characters as numbers, with each letter assigned a number from 0 to 127. For
~~~~~~

example, the ASCII code for uppercase M is 77. Most computers use ASCII codes to represent text, which makes it possible to transfer data from one computer to another.

The 8-bit Atari computers use a modified version of the ASCII character set called Atari ASCII, or ATASCII.

David Moeser produced this nice translation table.
Piotr Fusik corrected the description of Atari character 5.

ASCII TRANSLATION TABLE -- IBM & ATARI 8-BIT (ATASCII)

Subject: 7.3) What is Atari BASIC?

BASIC is an acronym for Beginner's All-purpose Symbolic Instruction Code. Developed by John Kemeney and Thomas Kurtz in the mid 1960s at Dartmouth College, BASIC is one of the earliest and simplest high-level programming languages, incorporating components of FORTRAN and ALGOL.

In 1978 Atari contracted with Shepardson Microsystems, Inc (SMI) to create a version of BASIC for their upcoming home computers. The following worked together on the project, which resulted in Atari BASIC:

Paul Laughton (author of Apple DOS) - project leader, co-primary contributor
Kathleen O'Brien - co-primary contributor
Bill Wilkinson - floating point scheme design
Paul Krasno - implemented the math library routines following guidelines supplied by Fred Ruckdeschel (author of the acclaimed text, BASIC Scientific Subroutines)
Bob Shepardson - Modified IMP-16 Assembler to accept special syntax tables Paul invented
Mike Peters - keypuncher/computer operator/junior programmer/troubleshooter

Three Revisions of Atari BASIC were produced: A, B, and C:
A - cartridge produced for use with the 400/800/1200XL
B - built-in to the 600XL/800XL, also produced on cartridge

C - built-in to the 800XL(late models)/65XE/130XE/800XE/XE Game System,
also produced on cartridge.

In order to find out what version you are running, at the READY prompt,
enter "? PEEK(43234)"

If the result is: You have Revision: Atari Part#:
162 A CO12402/CO14502
96 B CO60302A
234 C CO24947A

On versions A, B, and C, Greg Miller writes:
"Rev A had a number of bugs, not just the commonly described crash bug.
Rev B fixed most (maybe all, I don't remember) of these, but in the
process, they added a new bug. You see, the crashes were caused by a bug
in one of OSS's memory move routines. When the bug was fixed, the fix
mistakenly applied to a routine that actually worked in Rev A, causing the
new lockup problem.

Rev C differs in only a few bytes. AFAIK, the only change was to remove
the alteration made to the routine that was broken by Rev B.

Also concerning versions A, B and C, Russ Gilbert writes (3 Jul 2002):
"I've got an opinion on this, my opinion is wrong to 95% of Atari users.

B is a re-compile of A. C is a 12 byte patch to B.

I've used Atari BASIC for a millenium (?). B has less hangs and
ridiculous stuff like losing DIMs and stuff. C hangs like a lot. I must
admit I don't have very much experience with C as I go back to B after
using C for a short time.

I prefer B. I know its foibles. Just LIST, NEW, ENTER, SAVE every 5 or
6 SAVEs. Also, 0 REM will help with ENTERs that aren't working (put a
immediate 0 REM line before you ENTER.)"

Subject: 7.4) What are Atari DOS 1, DOS 2.0S, DOS 3, DOS 2.5, and DOS XE?

Here are short descriptions of the various Disk Operating Systems (DOS)
versions produced by Atari for use with their 8-bit computers.

The original Atari DOS shipped with all 810 disk drives from 1979-1981. It
consists of a single file, DOS.SYS, which is loaded into memory from disk on
startup.
At the top of the menu screen it reads:
DISK OPERATING SYSTEM 9/24/79
COPYRIGHT 1979 ATARI
Unless you are a collector, you probably have no reason to work with DOS 1.
Trivia: The "N. DEFINE DEVICE" menu option does not work.
The DOS 1 disk is labeled: Atari 810 Master Diskette (CX8101).

DOS II Version 2.0S was shipped with all 810 disk drives, and early 1050 disk drives, from 1981-1983. It consists of two files:
DOS.SYS is loaded into memory from disk on startup
DUP.SYS, which contains the DOS menu, is loaded only when needed.
MEM.SAV can be employed to preserve the contents of memory to disk when DUP.SYS is loaded, so that the data can be restored to memory when exiting from the DOS menu. DOS 2.0S supports Atari's proprietary single-sided, single density 90K 5.25" floppy disk format only. DOS 2.0S represents the lowest common denominator of Atari DOS versions--you can be assured than any Atari disk drive for the 8-bit Atari can work with disks formatted with DOS 2.0S. DOS 2.0S can read disks written with DOS 1; the reverse is not the case. The DOS 2.0S disk is labeled: Atari 810 Master Diskette II (CX8104).

DOS II Version 2.0D was shipped with the rare Atari 815 Dual Disk Drive. Supports double-density disk drives; also supports single-density disk drives.
The DOS 2.0D disk is labeled: Atari 815 Master Diskette (CX8201).

DOS 3 shipped with 1050 disk drives from 1983-1985. It was created in part to take advantage of the 1050's Dual-Density capability, by employing a single-sided, enhanced-density 128K 5.25" floppy disk drive format. Atari called this format "dual-density," but the Atari community quickly came to refer to this format as "enhanced-density" to better differentiate it from widely available 3rd-party truly double density disk drives and supporting versions of DOS. DOS 3 uses a disk format incompatible with DOS 2.0S. It included a utility to convert files from DOS 2.0S to DOS 3, but not back again. It used disk space less efficiently than DOS 2.0S. For these reasons and others, DOS 3 was not widely accepted by the Atari community, and like DOS 1 is not generally used except for curiosity's sake. The DOS 3 disk is labeled: Master Diskette 3 (DX5052).

DOS II Version 2.5 shipped with 1050 disk drives and early XF551 disk drives from 1985-1988. DOS 2.5 represented Atari's relenting to the masses, returning to DOS 2.0S compatability. DOS 2.5 very closely resembles DOS 2.0S, with just a few features added. It supports both DOS 2.0S single-density 90K formats, as well as an enhanced density 128K format for use with the 1050 disk drive. DOS 2.5 also includes a RAMdisk utility for use with the 128K 130XE computer, a utility to convert files from DOS 3 disks back to DOS 2.5, and other disk utilities. DOS 2.5 is just about as universal among Atari users as DOS 2.0S.

DOS XE shipped with XF551 disk drives from 1988-1992. Like DOS 3, DOS XE introduced a whole new format for Atari floppy disks; but unlike DOS 3, DOS XE also preserved general compatability with DOS 2.0S/2.5. DOS XE supports the full capabilities of the double-sided, double density 360K per 5.25" floppy disk XF551 disk drive, including that drive's high-speed burst mode. DOS XE also fully supports the 90K SS/SD capability of the 810 disk drive, the 128K SS/ED capability of the 1050 disk drive, the 180K SS/DD capability of most 3rd-party disk drives for the Atari, and a RAMdisk for use with the 130XE. Date-stamping of files is supported. DOS XE requires an XL or XE computer; it is not compatable with the 400/800 computer models. Even though DOS XE was critically well-received, and represented a substantial jump in capabilities

over DOS 2.5, its arrival came so late in the crouded realm of Atari and 3rd-party DOS versions that it never achieved much acceptance among real users, and is now relegated to the same status as DOS 1 and DOS 3 before it. Before its release, DOS XE was widely known as "ADOS."

Subject: 7.5) What are MyDOS, SpartaDOS, and other popular DOS versions?

Section includes contributions by Andreas Magenheimer (most DOS 2 clone descriptions).

Atari DOS versions are very popular, but many 3rd-party DOS versions have also been developed over the years. Of these, MyDOS and SpartaDOS seem to be the most-used today.

MyDOS 4.53
==========
MyDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support, along with many other "high-end" features.

MyDOS 4.53/3 was released as freeware by David R. Eichel on 1/1/90.
Defaults to a 3 character file length/free sector count instead of MyDOS's normal 4. Supports multiple AUTORUNs at boot up (*.AR0 through *.AR9).
Supports Axlon RAMdisks.

MyDOS 4.53/4 is the same as 4.53/3, but uses a minimum of four characters in the sector count just like most versions of MyDOS.

MYDOS 4.51 was developed by Wordmark Systems (Charles Marslett). Source code is available as "abandonware" at: http://www.wordmark.org/

MYDOS 4.50 was released on 11/28/88, developed by C. Marslett & R. Puff
http://www.nleaudio.com/css/files/MYDOS45M.ARC

Mathy van Nisselroy's MyDOS page:
http://www-users.rwth-aachen.de/mathy.van_nisselroy/mydos.htm

SpartaDOS 3.2, 3.3, X (4.22)
============================
SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MyDOS disks.

There are many versions available. Hopefully this list will help keep them all straight.

SpartaDOS X (SDX) cartridge

Greatly enhanced/expanded compared to disk- based SpartaDOS; completely different source code. Several versions produced:
4.22 11-05-95 released by Fine Tooned Engineering (FTe)
4.21 7-10-89 released by ICD
4.20 2-06-89 released by ICD
4.19 1-16-89 released by ICD

4.18 10-29-88 released by ICD
4.17 ?-?-88 released by ICD

SpartaDOS Pro 3.3a, 3.3b, and 3.3c - 1994-

The SpartaDOS Pro 3.3 versions were developed by Stephen J. Carden, based upon a dissembled copy of the older (more stable?) 3.2c release from ICD.
-- SpartaDOS Pro Ver 3.3a 3-Nov-94 -- Added MUX support and MS-DOS Commands. Highspeed SIO routines NOT included. Recommended for use in emulators (especially Xformer) only.
-- SpartaDOS Pro Ver 3.3b 25-Dec-95 -- Has two different SIOV handlers, one for the MUX and one for the MIO.
-- SpartaDOS Pro Ver 3.3c 1995 -- Looks at your system and by checking it determines what CIO handler to load, and has MS-DOS command set. Black Box, MUX, and MIO are fully supported, though none of these are required.
-- SpartaDOS Pro Ver 3.3c 19-Dec-97 -- the same 3.3c produced on a 16K ROM cartridge by Video 61.
-- SpartaDOS Pro Ver 3.3d -- exists, but is not in general release

According to Lance Ringquist:
K-Products contracted FTe to develop SpartaDOS Pro 3.3 for exclusive use and distribution with K-Products' BBS Express! Pro, to provide this BBS system with the most stable platform possible. As Video 61 now owns the rights to BBS Express! Pro, SpartaDOS Pro 3.3 is therefore now a product of Video 61.

According to Stephen Carden:
The SpartaDOS Pro 3.3 versions were never owned by K-Products, and are technically shareware owned by FTe, although FTe had no connection with the specific development of the 3.3 versions.

SpartaDOS 3.2g and 3.2gx - Dated 6/4/94.

Last official disk-based versions, released as shareware by Fine Tooned Engineering (FTe), who had purchased the rights from ICD. 3.2g is the primary version; 3.2gx differs only in that it locates the disk buffers under the OS to save RAM. 3.2gx is intended for use in systems that include a PBI device (MIO, Black Box); it is not compatible with BASIC XE or any other programs using RAM under the OS.

First shareware release from FTe: 3.2f.

Earlier major releases from the original developer, ICD: 3.2d, 3.2c, 2.3, 1.1

Only the SDX cartridges and the original version 1.1 are compatible with the 400/800 computer models; SpartaDOS 2.x, and 3.x require an XL/XE.

Many disk-based SpartaDOS versions are available for download here, Thunderdome, kept by SysOp Fox-1:
http://www7.brinkster.com/atari/ataridl/sdsys.htm

One source of SpartaDOS documentation is Russ Gilbert's page at:
http://my.en.com/~russg/

BW-DOS 1.30 and BW-DOS Update #2 - Released: 12/95 ("BeWe")
==========
Another popular, powerful DOS is BW-DOS, freeware by Jiri Bernasek. (it is pronounced "Bay Vay Dos") which is SpartaDOS compatible. Does not use any speeder internally, but comes with external XF551 speeder. Supports 4 drives and Ramdisk, comes with Ramdisk driver for XE compatible Ramdisks up to 1Megabyte; supports 4 densities: a) Single (90k), b) Enhanced/Medium (130k), c) Double (180k) and d) DSDD (360k); does not use any RAM under OS ROM; unlike SpartaDOS most commands are external, thus the DOS is only 5kbytes short; supports a PAL clock (made by ABBUC regional group "ARGS"); comes with many great utilities (which can also be used with SpartaDOS); paper printed German and disk printed English docs are avaiable; latest version 1.3 is avaiable as Freeware...

The other DOS varieties mentioned below are all, like MyDOS, Atari DOS-2 clones and thus DOS-2 compatible; avaiable as PD or Freeware...

TOP-DOS 1.5+
==========
Carolyn Hoglin writes:
This superior DOS was written by R. K. Bennett of Eclipse Software in Sunnyvale, CA. It was based on Atari DOS, but with many, many more features. It fully supports my double-density, double-sided Astra drives, automatically sensing the proper density and sidedness of both drives 1 and 2. (MYDOS only seemed to do that on drive 1.) Also supported are large ramdisks for Axlon, Mosaic, etc. The latest version was TOP-DOS 1.5+, which came with an excellent manual explaining how to use its powerful capabilities.

SuperDOS 5.1
==========
supports 4 formats SD/ED/DD/DSDD; supports 256k Xtra RAM/RD; supports 4 speeders: Happy+Speedy+XF551+US Doubler and its compatibles; has an AUX.SYS file with option to use / not use RAM under OS ROM; has unfortunately a very slow Ramdisk;

BiboDOS 5.4 and 6.4
==========
3 versions avaiable, one without speeder - 5.4NT, one with Happy/Speedy support 5.4HS and one with XF support 6.4XF; supports 4 formats / up to 360k; supports 256k Xtra Ram / RD; the DUP.SYS uses RAM under OS ROM, thus Turbo-BASIC must load without DUP;

Turbo-DOS 2.1
==========
Master-Disk produces 4 different versions: 2.1NT without speeders, 2.1HS for Happy/Speedy, 2.1XF for XF551 and 2.1EX for 3 speeders: Happy+Speedy+XF551; supports 256k Xtra RAM / RD and supports use of batchfiles; has converter for DOS 3 and DOS 4; supports 4 formats, up to 360k; does not use RAM under OS ROM; DUP uses a Command Processor; all commands are avaiable via HELP key; works with XL/XE computers only, does not load/boot on Atari 400/800 no clue why;

Subject: 7.6) How do I modify Atari DOS to support more than two drives?

Russ Gilbert writes:

DOS 2 type DOSes default to two drives.
Boot DOS and BASIC.
? PEEK(1802)
if it is 3 then you only recognize two drives.
To get the 3rd drive, poke 1802,7. Then go to dup.sys (type DOS)
and write system files. Next time you boot that DOS, you'll recognize
3 drives.
If you want four drives, poke 1802,15.

Subject: 7.7) Are there Graphical User Interfaces (GUIs) for the Atari?

Contributors: Andreas Magenheimer, Mathy van Nisselroy, Kathleen Ferrante

- Diamond GOS version 1 (a cart and a PD demo-disk-version do exist), version 2 (cart only), version 3 (cart only); plus some applications (painter program, text program, etc.); Diamond GOS has been made freeware by the author Alan Reeve;

- G.O.S., the Graphic operating system by Total Control systems; two different versions are avaiable (I call them GOS 1 and GOS 2) and they are PD;

- G.O.E., the Graphic Operating Environment also by Total Control Systems (this one merely works under Sparta DOS, not with Bewe-DOS and not at all with DOS 2.x); so far I have found 3 different versions (GOE 1,2,3) with some applications (graphic/painting program, etc.); PD;

- S.A.M., the Screen Aided Management (unfortunately it has the same name as SAM, the software aided mouth) from PPP/Germany. It is avaiable in two different versions: a) the type-in listing from Atari magazin and/or the Lazy finger disks (which are PD!) or b) the commercial version 2.0 which has many add-ons and can still be bought from Dean Garaghty/UK or PD-World-Versand/Germany; This GUI merely works correct under DOS 2.5 and Medium/dual density, however...

- BOSS-XL, the XL-Desktop from Mirko Sobe; written in Turbo-BASIC; freeware; http://www.atarixle.de/

- BOSS-XE, the XE-Desktop from Mirko Sobe; written in Turbo-BASIC;freeware, http://www.atarixle.de/

- BOSS-X the newest desktop version from Mirko Sobe, needs an 128k+ Computer (128k or more memory), supports MyDOS up to 16MB and MyDOS subdirs...; still written in Turbo-BASIC; many applications and drivers; freeware; http://www.atarixle.de/

- XL-TOS a small and "cheap" GUI version from Atari magazin (i.e. a type-in listing; the BASIC file, which consists of many data lines creates a short object code file); unfortunately this GUI only looks good, it loads almost nothing... PD;

- ST-TOS a small BASIC program, that looks like a GUI; it can merely load BASIC files and do a few DOS commands, like lock, unlock, delete and such... (PD)

- BASIC desktop, a GUI written in BASIC just as a sample, what can be done with an 8-bit computer; this one loads BASIC and text files (maybe also ML files); PD;

- DCS, the desktop construction set from Tom Hunt; there are 3 different versions avaiable, a) for DOS 2.5, b) for MyDOS andc) for Sparta-DOS; I have tested the Sparta DOS version, which worked with batchfiles and could easily load some ML files, text files and BASIC files (which were already on the DCS disk); it also works with high densities and/or hard disk partitions up to 16MB and supports subdirs of course; hmm, freeware or shareware ?!?

- ATOS - GUI by Tom Hunt/Closer To Home. http://cth.dtdns.net/atos/
1) Lets you use any demo or intro as a screen saver!!
2) Works with all Atari hardware, BB, MIO and Hard drives, SpartaDOS support
3) Lets you run files like full games and demos and then
return back to the desktop. It uses Overlays.

- Atari Desktop by ABC software (Poland), includes editors, converters, file copiers, sector copy, tape+turbo tape copy, small games, CMC finder and player and much much more; works with 64k RAM and keyboard input; disk manuals only in polish language...

- Windows XL a Turbo-BASIC GUI with some nice add-ons, like calculator, editor and other things. written in 1986-1988 by Joerg Forg.

- there are a lot more GUI programs, however many of them are written in BASIC or Turbo BASIC and are very restricted; most of them merely look like a GUI but need to much memory for everyday use. Thats why most users still prefer those DOS or Gamedos (Gameloader, Multiloader, etc.) programs...

Subject: 7.8) What should I know about modem device handlers?

In order to use a modem on the Atari, a modem software handler, or R: device handler, must be loaded into memory.

There are several families of R: handlers, corresponding to the different ways in which a modem may be attached to the Atari.

Except for family #7 below, these handlers are used in one of two ways. Either they are (A) loaded into memory from DOS just before running the main terminal application, or (B) the terminal program is appended to the handler, so that in practice, a single file is loaded from DOS which contains both the R: device handler and the application itself.

1) 835/1030/XM301 modems. Atari-only modems, interface via SIO

2) MPP/Supra modems. Atari-only modems, interface via joystick port

3) R-Verter cable. Connect standard Hayes-type modems via SIO
/ SX212 modem. A Hayes-compatible modem, interface via SIO

4) SWP ATR8000 interface. Standard Hayes-type RS232 modems via this interface.

Richard Anderson writes (Oct 2 02):
Mine originally came with a driver program; and, I believe, a BASIC program
to set up the driver from BASIC. Later they shipped with a special version
of MyDOS with the R: handler built in.

5) 850 Interface/P:R: Connection, internal

This type of "mini handler" simply loads the R: device handler code from a ROM
chip inside the RS232 serial interface. A long beep is heard through the
speaker when the handler is loaded into the computer's RAM.

Many varieties of DOS for the Atari include an explicit provision for loading
this type of R: handler into memory from the 850 or compatible interface.

Also, this type of R: handler is automatically loaded when any 8-bit Atari
computer is turned on with a P:R: Connection or powered 850 connected, but no
powered disk drive is present.

6) 850 Interface/P:R: Connection, external

Used with the 850/P:R: Connection in place of these interfaces' built-in
handlers.

7) MIO/Black Box interfaces, internal

These interfaces utilitize the PBI or ECI parallel ports on the Atari. They
include their own R: handlers in ROM, using no computer RAM at all.

8) MIO/Black Box interfaces, external: Len Spencer's Hyperspeed

This handler is "optional" for the Black Box, but "essential" for the MIO
in order to take full advantage of the high-speed hardware handshaking
capabilities of these two interfaces.

Hyperspd.arc is available at http://members.aol.com/lenspencer/atari8.htm

----

Subject: 8.1) What programming languages are available for the Atari?

Since last update by Freddy:
X-Assembler updates, 1/04
QS FORTH info from Winston Smith, 3/03
Much work on the FORTH section by MCurrent 4/03, based primarily on:
http://www.strotmann.de/twiki/bin/view/APG/LangForth from Carsten Strotmann

This section is by Freddy Offenga.

What programming languages are available for the Atari?

Revision : 1.8
Date.... : 2002-10-13

==
The goal is to give information about all available languages

for the Atari 8-bit computer. This information includes:
title, last version, author, date and a short description.
It would also be nice to know how to get it and where to get
more information (like reference cards, reviews and such).

Author: Freddy Offenga
Email : taf.offenga [at] chello.nl (replace " [at] " with "@")
URL : http://members.chello.nl/taf.offenga/atari.htm

==

There are quite a lot! To get some structure in this section it's
divided into the following categories;

a) ASSEMBLER
b) BASIC
c) C
d) PASCAL
e) LISP
f) FORTH
g) PILOT
h) LOGO
i) All the rest

The following format is used:

- Language titel (medium)
version, year : version, year
author/company : author/company
available..... : where/how to get it
package....... : programs, documentation
features...... : main features
Description.

The question marks (?) indicate that more information is
required about that topic.

Credits
=======
- The Multi-lingual Atari, Analog magazine 45, August 1986
- A bunch of manuals
- Some copy-pasted lines from the Atari 8-bit newsgroup
- umich (University of Michigan Atari archive)
- David Wyn Davies (PL65)
- Kevin Savetz (APX titles)
- Maury Markowitz
- Michael Current
- JT (ValForth)
- Andreas Magenheimer

Revision history
================

1.8
Thanks to Adreas Magenheimer for these updates:
- Added "Mesa-Forth"
- Added "130XE Assembler 4.32"
- Updated "SynAssembler"

1.7
Thanks to Maury Markowitz for these updates:
- Updated "A BASIC Compiler"
- Added "Der BASIC Compiler", "MMG BASIC Compiler"
- Added "Frost BASIC", "TT-BASIC XL"

1.6
Synchronized with Atari 8-bit FAQ May-2002 :
- Added "X-Assembler"
- Added "CTH Fast Basic"
- Added availability for "Deep Blue C"
- Added availability for "Atari Pascal"
- Ignored changes "Kyan Pascal" (need more info)
- Updated "ValForth"
- Updated "Extended fig-Forth"
- Updated "fun-Forth"
- Added "Extended WSFN"
- Removed e-mail addresses
- Added availability for "A65"
- Updated "PL65"

1.0 .. 1.5
Changes not noted.
Old versions are available on request.

a) ASSEMBLER

- 130XE Makro Assembler (disk)
version, year : 4.32, ?
author/company : Torsten Karwoth
available..... : freeware, ABBUC PD #297
package..... : assembler, editor, menu, monitor,
batch enhancement, linker/packer
features..... : macros
Two pass 6502 assembler with integrated menu, editor
and monitor shell for 128KB RAM Ataris. Source format
is derived from Atmas Makroassembler.

- 130XE+ Makro Assembler (disk)
version, year : 2.2, 1992
author/company : Torsten Karwoth
available..... : freeware, ABBUC PD #368
package..... : assembler, editor, menu, monitor,
batch enhancement, linker/packer
features..... : macros
New version with 128KB - 1088KB RAM support.
Two pass 6502 assembler with integrated menu, editor

and monitor shell. Needs extra RAM banks. Source
format is derived from Atmas Makroassembler.

- A65 (disk)
version, year : ?, 1989
author/company : Charles Marslett, WORDMARK Systems
available..... : abandonware, http://www.wordmark.org/
package..... : assembler, manual
features..... : source include
Two pass 6502 assembler. Source format is based on the
Atari Macro Assembler. Assembler source included.

- Alfasm, Turbo-Assembler/16 (disk)
version, year : 1.0, 1990
author/company : Jeff Williams, DataQue Software
available..... : ?
package..... : assembler, docs
features..... : source include
Two pass 6502/65816 assembler.

- Atari Assembler/Editor (cart)
version, year : ?, 1981
author/company : Atari
available..... : ?
package..... : assembler, editor, monitor, manual
features..... : -
Two pass 6502 assembler with integrated editor/monitor

- Atari Macro Assembler (disk) (CX8121)
version, year : 1.0C, 1981
author/company : Atari
available..... : ?
package..... : assembler, editor, debugger, manual
features..... : macros, source include
Two pass 6502 assembler.

- ATasm (disk)
version, year : 0.92, 1999
author/company : Mark Schmelzenbach
available..... : umich
package..... : assembler
features..... : macros, source include, optionally target .XFD
disk images and machine state files (Atari800 / Atari800Win),
conditional assembly. Two pass 6502 portable cross assembler.
Highly compatible with MAC/65.

- Atmas Makroassembler (disk)
version, year : 2, 1985
author/company : Peter Finzel, Hofacker
available..... : ?
package..... : assembler, editor, monitor, manual
features..... : macros

Two pass 6502 assembler with integrated editor/monitor.

- Bibo Assembler (disk)
version, year : ?, 1986
author/company : Compy-shop
available..... : ?
package....... : assembler, editor, monitor
features...... : source include, data include
Two pass 6502/65c02 assembler with integrated editor/
monitor.

- Datasm/65 assembler (disk)
version, year : 2.0, 1981
author/company : DataSoft Inc.
available..... : ?
package....... : assembler, editor, menu, manual
features...... : -
Two pass 6502 assembler.

- EASMD (disk)
version, year : 1.0, 1981
author/company : OSS
available..... : ?
package....... : assembler, editor, monitor
features...... : ?
Two pass 6502 assembler with integrated editor/monitor.

- Fast Assembler (disk)
version, year : 1.5, 1995
author/company : MMMG Soft
available..... : ?
package....... : assembler, editor, disassembler
features...... : ?

- Kasm65 (disk)
version, year : 2.51, 1997
author/company : Ken Siders
available..... : shareware, umich
package....... : assembler, editor, linker, docs
features...... : macros, relocation, source include,
conditional assembly
Two pass 6502 assembler. Relocatable object files are
compatible with ra65. Source format is derived from
the Atari Macro Assembler.

- MAC/65 Macro Assembler (disk|cart)
version, year : 2.00, 1982
author/company : Stephen D. Lawrow, OSS
available..... : ?
package....... : assembler, editor, monitor, manual
features...... : macros, source include
Two pass 6502 assembler with integrated editor/monitor.

Mac/65 is a direct descendant of the Atari Assembler/
Editor (via EASMD).

- MAE (disk)
version, year : .96, 1996
